technological systems become organized by commands from outside as when human intentions lead to the building of structures or machines but many natural systems become structured by their own internal processes these are the self organizing systems and the emergence of order within them is a complex phenomenon that intrigues

scientists from all disciplines unfortunately complexity is ill defined global explanatory constructs such as cybernetics or general systems theory which were intended to cope with complexity produced instead a grandiosity that has now mercifully run its course and died most of us have become wary of proposals for an integrated systems approach to complex matters yet we must come to grips with complexity some how now is a good time to reexamine complex systems to determine whether or not various scientific specialties can discover common principles or properties in them if they do then a fresh multidisciplinary attack on the difficulties would be a valid scientific task believing that complexity is a proper scientific issue and that self organizing systems are the foremost example r tomovic z damjanovic and i arranged a conference august 26 september 1 1979 in dubrovnik yugoslavia to address self organizing systems we invited 30 participants from seven countries included were biologists geologists physicists chemists mathematicians bio physicists and control engineers participants were asked not to bring manuscripts but rather to present positions on an assigned topic any writing would be done after the conference when the writers could benefit from their experiences there

min chen arie e kaufman and roni yage volume graphics is concerned with graphics scenes defined in volume data types where a model is specified by a mass of points instead of a collection of surfaces the underlying mathematical definition of such a model is a set of scalar fields which define the geometrical and physical properties of every point in three dimensional space as true 3d representations volume data types possess more descriptive power than surface data types and are morphologically closer to many high level modelling schemes in traditional surface graphics such as parametric surfaces implicit surfaces and volume sweeping the past decade has witnessed significant advances in volume visualisation driven mainly by applications such as medical imaging and scientific

computation the work in this field has produced a number of volume rendering methods that enable 3d information in a volumetric dataset to be selectively rendered into 2d images with modern computer hardware such a process can easily be performed on an ordinary workstation more importantly volume based rendering offers a consistent solution to the primary deficiencies of the traditional surface based rendering which include its inability to encapsulate the internal description of a model and the difficulties in rendering amorphous phenomena the emergence of volume based techniques has not only broadened the extent of graphics applications but also brought computer graphics closer to other scientific and engineering disciplines including image processing computer vision finite element analysis and rapid prototyping
