the third edition of an r companion to political analysis by philip h pollock iii and barry c edwards teaches your students to conduct political research with r the open source programming language and software environment for statistical computing and graphics this workbook offers the same easy to use and effective style as the other software companions to the essentials of political analysis tailored for r with this comprehensive workbook students analyze research quality data to learn descriptive statistics data transformations bivariate analysis such as cross tabulations and mean comparisons controlled comparisons correlation and bivariate regression interaction effects and logistic regression the clear explanations and instructions are aided by the use of many annotated and labeled screen shots as well as qr codes linking to demonstration videos the many end of chapter exercises allow students to apply their new skills the third edition includes new and revised exercises along with new and updated datasets from the 2020 american national election study an experiment dataset and two aggregate datasets one on 50 u s states and one based on countries of the world a new structure helps break up individual elements of political analysis for deeper explanation while an updated suite of r functions makes using r even easier students will gain valuable skills learning to analyze political data in r

this thesis presents new methods for exploring data using visualization techniques the first part of the thesis develops a procedure for visualizing the sampling variability of a plot the motivation behind this development is that reporting a single plot of a sample of data without a description of its sampling variability can be uninformative and misleading in the same way that reporting a sample mean without a confidence interval can be next the thesis develops a method for simplifying large scatter plot matrices using similar techniques as the above procedure the second part of the thesis introduces a new diagnostic method for regression called backward selection search backward selection search identifies a relevant feature set and a set of influential observations with good accuracy given the difficulty of the problem and additionally provides a description in the form of a set of plots of how the regression inferences would be affected with other model choices which are close to optimal this description is useful because an observation that one analyst identifies as an outlier could be identified as the most important observation in the data set by another analyst the key idea behind backward selection search has implications for methodology improvements beyond the realm of visualization this is described following the presentation of backward selection search real and simulated examples provided throughout the thesis demonstrate that the methods developed in the first part of the thesis will improve the effectiveness and validity of data visualization while the methods developed in the second half of the thesis will improve analysts abilities to select robust models
