the inspiration for translating this classic text came during a sabbatical year spent at the university of karlsruhe in 1974 under the leadership of the late professor hans rumpf the institut fur mechanische verfahrenstechnik karlsruhe from the early 1960s onwards by extensive research and advanced teaching had promoted the discipline of mechanical process technology a branch of process engineering which had been rather neglected especially in many chemical engineering departments of universities in the english speaking world there is a need for texts of this kind particularly for the more specialized teaching that has to be done during the later

stages of engineering courses this work which is really a monograph serves as a concise and compact introduction albeit at an advanced level to all those functions of process engineering that have to do with the handling and treatment of particulate matter and bulk solids much of this information has previously been scattered around journals and other books and not brought together in one work furthermore rumpf has emphasized the physical and theoretical foundations of the subject and avoided a treatment that is simply empirical

functionalization of material systems is one of the key developments nowadays in the textile industry where particles are frequently used to enhance the properties of fibers and to add new functionalities this book focuses on innovative textile materials and is a perfect guide for professionals in the textile industry and scientists alike an overview of particle technology is provided before addressing all topics relevant to particle enhanced textiles i e the properties and application of micro nanoparticles in textiles production techniques safety as well as regulatory and intellectual property aspects the book covers the composition and applications of various types of textile fillers finishings and microfibers gives an outlook on future trends and challenges in the research development and production of nano and micro enabled textiles the authors of the book who are leading experts in their fields address many aspects relevant to the use of particle enhanced textiles in industrial applications as well as in our daily life a particular emphasis is put on practical examples of applications and products safety and sustainability issues and the potential for further innovation this book should bring inspiration for textile scientists in using particles for improving textiles and further expanding their possibilities of use

if a substance is repeatedly subdivided the result is what are known as microscopic particles these particles are distinguished from the solid mass which they originally formed by the size of the surface area per unit weight this simple difference holds true down to a certain lower size limit and when this limit is exceeded a new state of matter is reached in which the behavior of the particles is quite different to that of the original solid particles in this state are termed superfine particles and are distinct from ordinary particles the size of the superfine particles that is to say the size limit below which particle behavior is completely different from the behavior of the original solid varies a good deal depending on the physical properties of the substance in question properties such as magnetism and electrical resistance are closely related to the internal structural properties of the particles themselves such as the magnetization processes of their respective magnetic domains and the mean free path of charged bodies this internal structure therefore limits the size of the superfine particles in ceramic processing on the other hand the surface area of the particles themselves becomes an even more important factor than their internal structure in this case the size of the superfine particles is determined by the interaction between water and solvents on the surface of the particles

this book contains a selection of high quality papers discussing the state of the art research in particle science and technology presented at the uk china international particle technology forum iv held at shanghai china in december 2013 cover

the branch of science which deals with the handling and processing of particles and powders is termed as particle technology it deals with the production modification handling and usage of a broad range of particulate materials these particles can be wet or dry as well

as vary in size from nanometers to centimeters some of the major areas of study associated with particle technology are the behavior of solids in bulk separation of particles through the processes such as tabling magnetic separation and sieving and particle size analysis it is also closely related to the field of mineral processing and petrochemical industry this book unfolds the innovative aspects of particle technology which will be crucial for the progress of this field in the future also included herein is a detailed explanation of the various concepts and applications of this field this book will also provide interesting topics for research which interested readers can take up

over half of the products of the chemical and process industries are sold in a particulate form the range of such products is vast from agrochemicals to pigments from detergents to foods from plastics to pharmaceuticals however surveys of the performance of processes designed to produce particulate products have consistently shown inadequate design and poor reliability particle technology is a new subject facing new challenges chemical and process engineering is becoming less concerned with the design of plants to produce generic simple chemicals which are often single phase fluids and is now more concerned with speciality effect chemicals which may often be in particulate form chemical and process engineers are also being recruited in increasing numbers into areas outside their traditional fields such as the food industry pharmaceuticals and the manufacture of a wide variety of consumer products this book has been written to meet their needs it provides comprehensive coverage of the technology of particulate solids in a form which is both accessible and concise enough to be useful to engineering and science students in the final year of an undergraduate degree and at master s level although it was written with students of chemical engineering in mind it will also be of use and interest to
