man's need for communication with his fellow man is possibly his greatest need and the fulfilment of his other needs and desires is largely dependent upon or at the last greatly facilitated by his ability to satisfy this basic one. Louise Tracy, defective hearing disrupts human communication; it gives rise to anxiety, frustration, stress, isolation, loss of self-esteem, even loss of livelihood for the individual with a reduced capacity to receive and interpret sound. Because we live in families and communities, the effects of hearing loss are not restricted to the impaired individual; those who associate with that person, especially those who are very close, are affected and prone to many of the same emotions and stresses. From the earliest times, man has sought for remedies for hearing loss: incantations, infusions, cuppings, and bleedings all have been advocated, and with the rare serendipitous exception have been equally ineffective. The only real assistance for countless generations was to cup the hand behind the ear and ask the speaker to raise their voice.

The development of new technology in hearing aid devices as well as imaging techniques has improved the possibilities of meeting the patient's individual needs. This book, in which experts from around the world have contributed comprehensively, covers advances in all aspects of hearing implantation. Otolaryngology chapters review the evidence behind the current applications of the wide range of hearing implants available for different types of hearing loss; further articles discuss the extended applications of implantation otology and let us have a glimpse into the future of hearing rehabilitation. New imaging techniques for the middle and inner ear are explored as well as innovations to improve eustachian tube function. The publication is essential reading to otolaryngologists, audiologists, and hearing rehabilitation professionals; it provides comprehensive coverage of the state of the art of hearing rehabilitation across the spectrum of hearing loss. As such, it is a perfect tool for those who wish to develop their knowledge within the field.

This book provides information and resources to assist in all stages of a client's implant program, building on a transdisciplinary model of practice. It includes material covering a wide variety of topics, including assessment, switch-on, client-focused auditory rehabilitation techniques for telephone training, communication therapy for social interactions, speech language therapy intervention, and psychosocial aspects of implant work. This is a practical text and should appeal to a range of professionals new to cochlear implants, including audiologists, hearing therapists, and psychologists, while providing the experienced clinician with new insights and fresh materials. The text's structure makes it ideal as a training tool for students.
