this book provides an introduction to the study of dynamic general equilibrium economic models time can either be modelled in a discrete or continuous fashion and the environment may be either deterministic or stochastic this generality accommodates both business cycle and economic growth modelling the purpose of the book is to teach first the tools employed in modern macroeconomic theory and second the topics most often encountered in macroeconomic debate while the focus of the textbook is on macroeconomic modelling the tools that are employed can also be applied to other fields in economics for example natural resource and environmental economics and industrial organization throughout the text the reader is exposed to both methodology and applications the scope and reach of a reader s own modelling is of course entirely a function of her own ingenuity with economic questions of interest

the conventional macroeconomic theory of the late twentieth and early twenty first century based on the assumption that the working of complex monetary economy could be analysed on the same principles as those of barter exchange has demonstrably failed this book provides a thorough rethinking of the nature of a monetary economy it builds upon a complete theory of the domestic and international monetary macro economy and of macroeconomic policy for the modern age central to the analysis is the idea that a successful market economy requires an endogenous supply of money via the banking system therefore to

achieve macroeconomic stability the book proposes the targeting of real interest rates under a regime of flexible exchange rates or fixed but adjustable exchange rates as the main goal of monetary policy along with a range of innovative fiscal and trade policies to promote economic growth and thereby achieve full employment and a fair distribution of income
