this textbook provides an accessible introduction to physics for undergraduate students in the life sciences including those majoring in all  
branches of biology biochemistry and psychology and students working on pre professional programs such as pre medical pre dental and  
physical therapy the text is geared for the algebra based physics course often named college physics in the united states the order of topics  
studied are such that most of the problems in the text can be solved with the methods of statics or dynamics that is they require a free body  
diagram the application of newton's laws and any necessary kinematics constructing the text with a standardized problem solving  
methodology simplifies this aspect of the course and allows students to focus on the application of physics to the study of biological systems  
along the way students apply these techniques to find the tension in a tendon the sedimentation rate of red blood cells in haemoglobin the  
torques and forces on a bacterium employing a flagellum to propel itself through a viscous fluid and the terminal velocity of a protein moving  
in a gel electrophoresis device this is part one of a two volume set volume 2 introduces students to the conserved quantities and applies these  
problem solving techniques to topics in thermodynamics electrical circuits optics and atomic and nuclear physics always with continued focus  
on biological applications key features organised and centred around analysis techniques not traditional mechanics and e m presents a unified

approach in a different order meaning that the same laboratories equipment and demonstrations can be used when teaching the course demonstrates to students that the analysis and concepts they are learning are critical to the understanding of biological systems
