the book gives an account of the inspirations that initiated the enquiry into the physical world and its evolution as a discipline simultaneously it motivates the reader to step ahead with a little dismay to undertake a journey in the astonishing world of

physics it starts with the observation of nature and posits the questions which kept perplexing the mind of great physicists of our time in finding answers it verily explores the relationship of the observer with the object and while so doing it catapults the readers into the bizarre world of natural laws equations hypothesis and theorems the presentation reserves its difference unlike books published these days in the treatment of the subject without involving mathematics or without making tall claims of seeking wishful comparison between science and religion on the other hand it paves way to a systematic shift from traditional approach to newer and broader similarities between physical and the mental realities this effort gleans out a humane paradigm from where we see our known world in new light therefore it asks for a limpid mind to welcome one into the world of physics this book presents physics not only as technology booster but also as life builder

a clear concise introduction to the quickly growing field of complexity science that explains its conceptual and mathematical foundations what is a complex system although complexity science is used to understand phenomena as diverse as the behavior of honeybees the economic markets the human brain and the climate there is no agreement about its foundations in this introduction for students academics and general readers philosopher of science james ladyman and physicist karoline wiesner develop an account of complexity that brings the different concepts and mathematical measures applied to complex systems into a single framework they introduce the different features of complex systems discuss different conceptions of complexity and develop their own account they explain why complexity science is so important in today s world

we utilise principles of mass energy distribution and similitude by zpf equilibria to derive the values of the present hubble constant  $h_0$  and cmbr temperature  $t_0$  it is demonstrated that a mathematical relationship exists between the hubble constant and cmbr temperature such that  $t_0$  is derived from  $h_0$  the values derived are  $67.0843 \text{ km s mpc}$  and  $2.7248 \text{ k}$  respectively we also derive improved estimates for the solar distance from the galactic centre  $r_0$  and total galactic mass  $m_g$  as being  $8$

1072 kpc and  $6.3142 \times 10^{11}$  solar masses respectively the construct herein implies that the observed accelerated expansion of the universe is attributable to the determination of the zpf energy density threshold  $u_{zpf}$  being
