this report describes a new imposed solution transmissive boundary capability that has been made operational in the brl version of the airblast hull hydrodynamics code which can be used

for 3 d blast loading computations on rigid structures until this time 3 d blast loading computations have been done by either mapping a 2 d blast wave into the 3 d grid and assigning simple transmissive boundaries or by imposing a planar constant value non decaying wave or by imposing a decaying wave as defined by the lamb coding the boundary values for these input waves could only be imposed at two or three of the boundaries the new imposed solution boundaries for 3 d cartesian coordinates allow the time dependent definition of flow field conditions to be imposed at all six boundary planes the flow field conditions for these planes may be obtained from a previously run 2 d cylindrical hull computation through the use of a new program hullup this new capability permits better definition of free field flow conditions at boundaries and thus extends the time that a given grid will produce results on a target that are uncontaminated by artificial waves from improperly defined boundaries listings of the changes to hull the hullup program and sample runstreams for hullup keel and hull are included

as in the sixth edition end of chapter problems are divided into two groups questions and problems and assignment questions solutions to the questions and problems are in options futures and other derivatives 7e solutions manual which is published by pearson and can be purchased by students

two related problems are studied in this thesis we refer to them as the real and the complex case in the real case we are interested in hulls  $\hat{K}$  of compact sets  $K$  in  $\mathbb{R}^n$  a hull  $\hat{K}$  is a minimal compact set in  $\mathbb{R}^n$  that contains  $K$  and has the property that the equation  $d\phi = f$  has a solution  $f$  whose support is arbitrarily close to  $\hat{K}$  for any given  $q$  form  $\phi$  on  $\mathbb{R}^n$  whose support is contained in  $K$  in the complex case the analogous problem for the equation  $\bar{\partial} f = \phi$  on  $\mathbb{C}^n$  is studied here  $\phi$  is a  $0, q$  form in both cases we prove that hulls exist but are not unique unless  $\hat{K} = K$  or  $q = 1$  in the real case we use de rham theory to characterize hulls  $\hat{K}$  as the minimal compact sets containing  $K$  and satisfying the condition  $i^* \alpha = 0$  where  $i^* : H_n(K) \rightarrow H_n(\hat{K})$  is a natural map on the real homology groups induced by the inclusion  $i : K \hookrightarrow \hat{K}$  as a consequence we observe that  $\hat{K} = K$  precisely when  $H_n(K) = 0$  next we turn to the study of polyhedral hulls we prove that they always exist and are obtained by adding to  $K$  a finite number of simplicial  $n - q + 1$  chains that lie in the complement of  $K$  and have their boundary in  $K$  finally we apply these results to prove a theorem about the topology of hyperplane sections of  $K$  in  $\mathbb{R}^n$  to study of the complex case is complicated by the fact that geometric and analytic dualities for the dolbeault cohomology hold only under certain conditions we use andreotti grauert theory to find some conditions that imply  $\hat{K} = K$  and in case  $\hat{K}$  is polyhedral prove some estimates on the dimension of  $\hat{K} \setminus K$  in particular we show that there exist polyhedral hulls that satisfy  $\dim \hat{K} \setminus K \leq 2n - q + 1$  and that arbitrary hulls can be approximated by such polyhedral hulls next fibered hulls are considered they turn out to be related to polynomial hulls and provide some interesting examples as an application of the theory developed we prove that bar partial cohomology classes of open subsets of  $\mathbb{C}^n$  can be represented by  $0, q$  forms supported arbitrarily close to a closed set of hausdorff dimension at most  $2n - q$
