this book presents chapters exploring the most recent developments in the role of technology in proving the full range of topics related to this theme are explored including computer proving digital collaboration among mathematicians mathematics teaching in schools and universities and the use of the internet as a site of proof learning proving is sometimes thought to be the aspect of mathematical activity most resistant to the influence of technological change while computational methods are well known to have a huge importance in applied mathematics there is a perception that mathematicians seeking to derive new mathematical results are unaffected by the digital era the reality is quite different digital technologies have transformed how mathematicians work together how proof is taught in schools and universities and even the nature of proof itself checking billions of cases in extremely large but finite sets impossible a few decades ago has now become a standard method of proof distributed proving by teams of mathematicians working independently on sections of a problem has become very much easier as digital communication facilitates the sharing and comparison of results proof assistants and dynamic proof environments have influenced the verification or refutation of conjectures and ultimately how and why proof is taught in schools and techniques from computer science for checking the validity of programs are being used to verify mathematical proofs chapters in this book include not only research reports and case studies but also theoretical essays reviews of the state of the art in selected areas and historical studies the authors are experts in the field

this research has demonstrated that the exploratory tutorial approach to program evaluation and revision provides a powerful technique for developing effective programmed materials and for generating hypotheses about important program variables three generalizations or principles were induced from the observations made during the tutorial

sessions in the four subject areas the principles are 1 every skill included in the program objectives and every subskill that logically contributes to those objectives should be explicitly covered by the program unless it exists in the student's entry repertoire 2 any materials that do not contribute to the program objectives as indicated by logical analysis should be eliminated and 3 the student should be required to demonstrate mastery of each component subskill before he is allowed to advance to new topics that are based on the earlier materials the three principles of program improvement filling gaps eliminating irrelevancies and requiring mastery although intuitively obvious bear the added strength of having been induced empirically from independent observations two of these principles received experimental verification with another program and a new sample of students
