this book combines elementary theory from computer science with real world challenges in global geodetic observation based on examples from the geodetic observatory wettzell germany it starts with a step by step introduction to developing stable and safe scientific software to run successful software projects the use of software toolboxes is another essential aspect that leads to the application of generative programming an example is a generative network middleware that simplifies communication one of the book s main focuses is on explaining a potential strategy involving autonomous production cells for space geodetic techniques the complete software design of a satellite laser ranging system is taken as an example such automated systems are then combined for global interaction using secure communication tunnels for remote access the network of radio telescopes is used as a reference combined observatories form coordinated multi agent systems and offer solutions for operational aspects of the global geodetic observing system ggos with regard to industry 4 0

this self contained introduction to modern cryptography emphasizes the mathematics behind the theory of public key cryptosystems and digital signature schemes the book focuses on these key topics while developing the mathematical tools needed for the construction and security analysis of diverse cryptosystems only basic linear algebra is required of the reader techniques from algebra number theory and probability are introduced and developed as required this text provides an ideal introduction for mathematics and computer science students to the mathematical foundations of

modern cryptography the book includes an extensive bibliography and index supplementary materials are available online the book covers a variety of topics that are considered central to mathematical cryptography key topics include classical cryptographic constructions such as diffie hellmann key exchange discrete logarithm based cryptosystems the rsa cryptosystem and digital signatures fundamental mathematical tools for cryptography including primality testing factorization algorithms probability theory information theory and collision algorithms an in depth treatment of important cryptographic innovations such as elliptic curves elliptic curve and pairing based cryptography lattices lattice based cryptography and the ntru cryptosystem the second edition of an introduction to mathematical cryptography includes a significant revision of the material on digital signatures including an earlier introduction to rsa elgamal and dsa signatures and new material on lattice based signatures and rejection sampling many sections have been rewritten or expanded for clarity especially in the chapters on information theory elliptic curves and lattices and the chapter of additional topics has been expanded to include sections on digital cash and homomorphic encryption numerous new exercises have been included
