over the past thirty five years there has been an explosive increase in scientists ability to explain the structure and functioning of the human brain while psychology has advanced our understanding of human behavior various other sciences such as anatomy physiology and biology have determined the critical importance of synapses and through the use of advanced technology made it possible actually to see brain cells at work within the skull s walls here jean pierre changeux elucidates our current knowledge of the human brain taking an interdisciplinary approach and explaining in layman s terms the complex theories and scientific breakthroughs that have significantly improved our understanding in the twentieth century

the human brain occupies a unique position among the organs of the human body with its 1010 nerve cells and the innumerable interconnections it is the most complex living system we know it is the prerequisite for all though feeling and action and hence for the awareness of ourselves in many religions and philosophies it was and is considered to be the seat of the immortal soul for centuries some individuals looked upon the mentally ill with holy reverence and others responded with shock and radical social ostracism in the neurosciences too the brain is not just one organ among many as with the genome it is considered to be an information storage unit but whereas the genetic information cannot be influenced by the individual carrier the brain can learn that is it is capable of storing information from the life history of its carrier and it can pass this information on the neurosciences are an area of research that has cut across the boundaries of the classic disciplines and now includes a broad spectrum ranging from basic research to

clinical medicine these sciences have developed remarkable momentum since they have taken an interdisciplinary approach and made use of experimental techniques and concepts developed in the fields of physics biochemistry molecular biology behavioral physiology experimental psychology and computer science

through a series of original essays this book unites an international team of renowned researchers and educators around the theme of knowledge dialogue spanning topics from natural complexity to neuroscience from education theory to climate change from immunology to archaeology and human migrations it allows for an atmosphere of constructi

bernadette h̄fer s innovative and ambitious monograph argues that the epistemology of the cartesian mind body dualism and its insistence on the primacy of analytic thought over bodily function has surprisingly little purchase in texts by prominent classical writers in this study h̄fer explores how surin molière lafayette and racine represent interconnections of body and mind that influence behaviour both voluntary and involuntary and that thus disprove the classical notion of the mind as distinct from and superior to the body the author s interdisciplinary perspective utilizes early modern medical and philosophical treatises as well as contemporary medical compilations in the disciplines of psychosomatic medicine neurobiology and psychoanalysis to demonstrate that these seventeenth century french writers established a view of human existence that fully anticipates current thought regarding psychosomatic illness

though the subject of this work nominalism and contemporary nominalism is philosophical it cannot be fully treated without relating it to data gathered from a great variety of domains such as biology and more especially ethology psychology linguistics and neurobiology the source of inspiration has been an

this book is the first to discover and probe in depth memory phenomena captured in literary works using literature as a laboratory for the workings of the mind this comparative study of writers from jean jacques rousseau to octavio paz including proust breton woolf and faulkner uncovers valuable material for the classification of the memory process nalbantian s daring interdisciplinary work involving literature science and art forges a new model for dialogue between the disciplines

neural networks are a number of different models intended to imitate some of the functions of the human brain the authors aim to convey an intuitive and practical understanding of the topic and to provide the foundations necessary before undertaking further study

it is expected that neural networks will find their niche among the methods and techniques that computer

scientists use for intrinsically difficult problems an attraction of neural networks is the dialogue established between computer science biology physics psychology numerical and non linear analysis and other areas in the future it may be discovered that neural networks are useful for the computationally fast and approximate solution of certain decision problems which are based on simultaneously acting diverse criteria with information of different forms this book is a snapshot of academic and industrial research in neural network theory and of its major applications written by active contributors to the field including computer scientists electrical engineers and physicists
