designed to provide students with a foundation in understanding and interpreting histologic and cytologic preparations color atlas of veterinary histology is a practical benchside reference focusing on the normal histology of eight common domestic species this third edition has been revised with new images information and updated terminology throughout introductory chapters have also been expanded to offer more complete coverage of the basic types of tissues providing an even more thorough grounding in the principles of histology for the first time the more than 900 photomicrographs are available digitally in an interactive atlas on cd offering images available for download with zoom capability the new edition of this veterinary specific histology atlas provides veterinary and veterinary technician students with an essential pictorial resource for interpreting histologic preparations

the allen laboratory manual for anatomy and physiology 6th edition contains dynamic and applied activities and experiments that help students both visualize anatomical structures and understand complex physiological topics lab exercises are designed in a way that requires students to first apply information they learned and then critically evaluate it with many different format options available and powerful digital resources it's easy to customize this laboratory manual to best fit your course

applications of graph theory and topology in inorganic cluster and coordination chemistry is a text reference that provides inorganic chemists with a rudimentary knowledge of topology graph theory and related mathematical disciplines the book emphasizes the application of these topics to metal clusters and coordination compounds the book's initial chapters present background information in topology graph theory and group theory explaining how these topics relate to the

properties of atomic orbitals and are applied to coordination polyhedra subsequent chapters apply these ideas to the structure and chemical bonding in diverse types of inorganic compounds including boron cages metal clusters solid state materials metal oxide derivatives superconductors icosahedral phases and carbon cages fullerenes the book s final chapter introduces the application of topology and graph theory for studying the dynamics of rearrangements in coordination and cluster polyhedra

this book presents critical reviews of the present state and future trends in research concerned with chemical structure and bonding concentrating on zintl ions and related materials

recent advances in experimental techniques now enable researchers to produce in a laboratory clusters of atoms of desired composition from any of the elements of the periodic table this has created a new area of research into novel materials since clusters cannot be regarded either as a large molecule or as a fragment of the bulk both experimental and theoretical studies are revealing unusual properties that are not observed in solid state environments the structures of micro clusters are found to be significantly distorted from the most symmetric arrangement some even exhibiting pentagonal symmetry commonly found in icosahedric structures the unusual stability of certain clusters now described as magic number species shows striking similarities with the nuclear shell structure the relative stabilities of clusters depend not only on the composition of the clusters but also on their charged states the studies on spontaneous fragmentation of multiply charged clusters commonly referred to as coulomb explosion illustrate the role of electronic bonding mechanisms on stability of clusters the effect of foreign atoms on geometry and stability of clusters and the interaction of gas atoms with clusters are showing promise for an indepth understanding of chemisorption and catalysis the magnetic and optical properties are dependent not only on cluster size but also on its geometry these findings have the potential for aiding industry in the area of micro electronics and catalysis
