1997 the centennial year of the electron provides a good occasion to publish the first english translation ever made of h a lorentz s doctoral dissertation of 1875 just 22 years old lorentz took up and handled magisterially one major unresolved problem of maxwell s electromagnetic theory the reflection and refraction of light by then the superiority of maxwell s electromagnetic ether theory over current elastic solid conceptions such as fresnel s was not nearly a settled issue in his dissertation lorentz strove with considerable success to make it that still he found that neither theory allowed for a satisfactory account of dispersion one intriguing aspect of lorentz s earliest scientific achievement which within two years was to earn him the chair of theoretical physics at leyden university is that a range of subjects soon to occupy him for the rest of his life are already clearly foreshadowed in it so far lorentz s first step in science has existed only in the original dutch and in a french translation made long ago as part of the collected works here the joint translators have striven to provide a fluently readable full text while preserving the flavor of lorentz original language and style

this numerical model solves for water wave height angle and number directly on a rectangular grid required input are the deepwater wave height period and direction and the bathymetry in the region of interest the model employs a finite difference scheme the irrotationality equation of the wave number vector is solved for the wave angle and the conservation of energy flux equation is solved for the wave height iteration is required a

closed form expression to third order for the time averaged vertically integrated energy flux is derived. Stokes second definition of wave celerity is used in the derivation to reduce the number of intermediate calculations. Expressions for the wave energy and the group velocity are also derived. The model is written such that both first order linear and third order Stokes wave theory model computations may be conducted. The modeling process begins at higher intermediate depth or deep water and waves are propagated shoreward until an Ursell number of 25 or another user specified value is reached. The model is applied for the following cases: a comparison of small amplitude and finite amplitude wave refraction and shoaling on a plane beach; b) refraction and shoaling over an irregular bottom configuration; and c) comparison of the model shoaling predictions to laboratory data of Iverson 1951.
