in the overlapping generations model with uncertain lifetimes efficient life insurance markets and no operative intergenerational gift and bequest motive a positive birth rate has been shown to be sufficient and necessary for absence of debt neutrality equilibrium prices and quantities are independent of the mix of government borrowing and lump sum taxation holding constant the path of exhaustive public spending implicit in this analysis has been the assumption that the lump sum tax is a tax on the income from human capital postponing lump sum taxes then makes it possible to shift part of the tax burden to future generations if the birth rate is positive if instead the tax falls on the income from a non human fixed factor land whose ownership claims are priced efficiently then if all land is owned by generations currently alive changes in the intertemporal pattern of taxation do not permit current generations to shift the tax burden to future generations taxes on the income from all fully owned non human factors have this property even those factors supplied elastically but the latter will of course be subject to the familiar incentive or allocative effects of changes in non lump sum taxation

we reexamine the expectations theory of the term structure using data at the short end of the maturity spectrum we find that prior to the founding of the federal reserve system in 1915 the spread between long rates and short rates has substantial predictive power for the path of interest rates after 1915 however the spread contains much less predictive power we then show that the short rate is approximately a random walk after the founding of the fed but not before this latter fact coupled with even slight variation in the term premium can explain the observed change in 1915 in the performance of the expectations theory we suggest that the random walk character of the short rate may be attributable to the federal reserve's commitment to stabilizing interest rates

lack of income convergence for the world as a whole has led to concerns about the impact of globalization of markets on world inequality gdp per capita is usually used to proxy for the quality of life of individuals living in different countries however well being is also affected by quantity of life as represented by longevity this paper incorporates longevity into an overall assessment of the evolution of cross country inequality the absence of income convergence noticed in the growth literature is in stark contrast with the reduction in inequality after incorporating recent gains in longevity the paper computes a full income measure to value the life expectancy gains experienced by 49 countries between 1965 and 1995 countries starting with lower income tended to grow more in terms of full income than countries starting with higher income the average growth rate of full income is about 140 for developed countries compared to 192 for developing countries additionally we decompose changes in life expectancy into changes attributable to thirteen broad groups of causes of death infectious respiratory and digestive diseases congenital and perinatal conditions and ill defined conditions are responsible for most of the mortality convergence observed between 1965 and 1995

physicians advice to stop smoking has been found to increase smoking cessation rates in controlled clinical trials however these finding may not be

applicable under real world conditions this paper investigates the impact of physicians advice and tobacco control policies on conditional cigarette demand among adults employing non experimental data because the data is non experimental the variable reflect physician advice to stop smoking and cigarette consumption are likely to be endogenous we implement a three stage least squares regression technique designed to take account the joint determination of physician advice and cigarette smoking the results from these models imply that smokers that received advice from their physician to quit smoking will decrease their average daily consumption by between 5 6 cigarettes per day as compared to smoker who do not receive advice this result implies that physicians advice is effective in curtailing smoking in real world settings other policies that were found to decrease average smoking by smokers include the real price of cigarettes and clean indoor air laws

this study presents a model of labor supply in which individuals may face constraints on their choice of work hours and analyzes the sensitivity of parameter estimates and policy conclusions to the usual assumption of unrestricted choice we set up the labor supply decision as a discrete choice problem where each worker faces a finite number of employment opportunities each offering fixed hours of work the distribution from which these are drawn as well as the number of draws is estimated along with the behavioral parameters of individual labor supply the standard model with unconstrained hours appears as a special case where the number of draws approaches infinity we estimate the mean absolute difference between desired and actual work hours to be about ten hours per week the results strongly support the notion that hours choices are constrained and suggest that models which ignore restrictions on hours worked may yield biased estimates of the wage elasticity of desired hours further we suggest that analysis of policies such as income transfers and the flat rate tax which do not consider their effects on the distribution of hours offered may be very misleading

the age structure of capital plays an important role in the measurement of productivity it has been argued that the slowdown in the 1970 s can be ascribed to the aging of the stock of capital in this paper we incorporate the age structure in productivity measurement a proposition proves that nelson s 1964 formula is wrong our final proposition shows that inclusion of the vintage effect prompts an upward correction of measured productivity growth in times of an aging stock of capital here capital ages if the investment capital ratio falls short of the inverse of the capital age as a first proposition shows the analysis rests on a rigorous accounting for vintages we translate the bureau of economic analysis age of capital data into a measure of rates of obsolescence empirically the correction of productivity growth for the vintage effect requires an estimate of the obsolescence and depreciation parameters on the basis of age data the results indicate that the use of capital stock in efficiency units does cause some smoothing of total factor productivity growth over time in the 1950s when investment accelerated the vintage adjusted capital growth rate well exceeded the bea growth rate and vintage adjusted tfp growth is significantly lower than unadjusted tfp growth the measured productivity slowdown of the 1970s is somewhat ameliorated

the special role of money in the hyper inflation process and particularly in the stabilization phase has now been reconsidered in a bestselling essay by sargent the message is that credible fiscal stabilization is the sine qua non of stopping inflation this is definitely not viewed as being in conflict with the monetary hypothesis but it does represent a shift of emphasis we draw attention to a third aspect of the hyperinflation process and the stabilization namely exchange rate and interest rate policy even though a government may accomplish all the right measures in terms of budget stabilization or control of money creation there remains the problem of making these measures credible and hence being able to actually achieve them we argue that exchange rate and interest rate policy in the transition have traditionally formed the vehicle for establishing that credibility by a de facto stabilization we make that point by discussing the events of the german hyperinflation in that case the stabilization was a much more diffuse accidental matter than a reading of the classics reveals with exchange rate policy playing a key role immensely high interest rates in the face of a sharply appreciating free market exchange rate wiped out adverse speculation thus helping to establish stabilization the real exchange rate sharply appreciated in the final stage and persisted at an appreciated level well into the post stabilization phase it reflects the reverse of the coin of real depreciation in the capital flight phase

empirical evidence suggesting that a considerable amount of horizontal strategic interaction exists amongst governments is important in light of recent devolutionary trends of many important public programs the empirical approach in these studies typically relies on estimating reaction functions in a uni dimensional policy framework where a nonzero slope estimate is interpreted as evidence in support of strategic interactions while this framework is a useful representation within certain contexts it is potentially too restrictive for example in models of resource competition localities may use multiple instruments in their recruiting pursuits leading to potential strategic interactions across policy instruments in this study we first develop a simple theoretic construct that includes resource competition in a world of three dimensional policy choice the model suggests that

while a zero sloped reaction function may exist for any particular policy this does not necessarily imply the absence of strategic interactions we examine the implications of the model empirically using us state level panel data over the period 1977 1994 the results suggest that important cross policy strategic interactions exist lending support in favor of the multi dimensional framework and indicate that uni dimensional frameworks may present lower bound estimates of the degree of strategic interaction

in the 1980s the composition of immigrants to the u s shifted towards less skilled workers around this time real wages and employment of younger and less educated u s workers fell some blame recent immigration shifts for the misfortunes of unskilled workers in the u s ols estimates using census data show instead that native wages are positively related to the recent influx of latin americans however these estimates are biased if demand shocks are positively related to immigration an iv strategy which deals with the endogeneity of immigration by exploiting a large influx of central american immigrants towards u s southern ports of entry after hurricane mitch also generates positive wage effects but only for more educated native men yet ignoring the flows of native and earlier immigrants in response to this exogenous immigration is likely to generate upward biases in these estimates too native wage effects disappear and less skilled employment of previous latin american immigrants falls when controlling for out migration this highlights the importance of controlling for out migration not only of natives but also of previous immigrants in regional studies of immigration

this paper addresses two questions i how do governments actually pay for the fiscal costs associated with currency crises and ii what are the implications of different financing methods for post crisis rates of inflation and depreciation we study these questions using a general equilibrium model in which a currency crisis is triggered by prospective government deficits we then use our model in conjunction with fiscal data to interpret government financing in the wake of three recent currency crises korea 1997 mexico 1994 and turkey 2001
