vols for 1975 include publications cataloged by the research libraries of the new york public library with additional entries from the library of congress marc tapes

in a book that promises to change the way we think and talk about genes and genetic determinism evelyn fox keller one of our most gifted historians and philosophers of science provides a powerful profound analysis of the achievements of genetics and molecular biology in the twentieth century the century of the gene not just a chronicle of biology s progress from gene to genome in one hundred years the century of the gene also calls our attention to the surprising ways these advances challenge the familiar picture of the gene most of us still entertain keller shows us that the very successes that have stirred our imagination have also radically undermined the primacy of the gene word and object as the core explanatory concept of heredity and development she argues that we need a new vocabulary that includes concepts such as robustness fidelity and evolvability but more than a new vocabulary a new awareness is absolutely crucial that understanding the components of a system be they individual genes proteins or even molecules may tell us

little about the interactions among these components with the human genome project nearing its first and most publicized goal biologists are coming to realize that they have reached not the end of biology but the beginning of a new era indeed keller predicts that in the new century we will witness another cambrian era this time in new forms of biological thought rather than in new forms of biological life

this book integrates the work of philosophers of science seeking to make sense of genetics with an accessible introduction to the science
