this book develops some methods and structures to improve the power inverters for different applications in a single phase or three phase output in recent years the reduction of the switching devices and multilevel inverters as changing structure for the power inverters and pdm and pwm methods as changing control methods for the power inverter are studied in this book moreover power inverters are developed to supply open ended loads furthermore the basic and advanced aspects of the electric drives that are control based are taught for induction motor im based on power inverters suitable for both undergraduate and postgraduate levels the main objective of this book is to provide the necessary background to improve and implement the high performance inverters once the material in this book has been mastered the reader will be able to apply these improvements in the power inverters to his or her problems for high performance power inverters

power electronic converters are nowadays the most suitable solution to provide a variable voltage current in industry the most commonly used power converter is the three phase two level voltage source inverter which transforms a direct current input voltage into alternating current output voltage with adjustable magnitude and frequency power

inverters are used to supply three phase loads which are typically connected in wye or delta configurations however in previous years a type of connection consisting on leaving both terminal ends of the load opened has been studied as an alternative to standard wye or delta connection to supply loads with this type of connection two power inverters one at each terminal end of the load are required in a circuit topology called dual inverter in this chapter a general study of the dual inverter topology is presented the advantages and issues of such converter are studied and different modulation strategies are shown and discussed moreover multilevel dual inverter converters are presented as an extension to the basic two level idea for evaluation purposes simulations results are presented

as the proliferation of electric vehicles becomes more prevalent in the transportation sector power electronic traction inverters used in these systems have been critically evaluated with the thrust on improving inverter efficiency reliability and reduced passive components different variants of inverter topologies have been previously proposed and investigated amongst them dual inverter topologies represent an emerging trend that has experienced growth this thesis investigates the modulation and control strategies of dual inverter topologies using conventional two level and three level t type voltage source converters for traction applications the thesis includes an overview of firstly the different variants of traction inverter topologies along with the advantages and disadvantages associated with them the advantages and research potential of the dual inverter topology is considered secondly an interleaved modulation strategy for the dual two level inverter topology is discussed which improves the performance of the passive dc link capacitor of the inverters thirdly a dual three level t type inverter topology is proposed which reduces the dc link capacitor voltage balancing problem associated with a conventional three level inverter additionally the topology decouples modulation strategies to reduce switching losses from voltage balancing strategies moreover three different modulation strategies for three level inverters are proposed firstly a discontinuous modulation strategy is presented which improves loss and thermal distribution of the three level t type inverter switching devices at lower modulation indices the strategy entails the inverter to increase its current throughput around 30 or utilize up to 35 higher switching frequency secondly a three level generalized discontinuous modulation algorithm is proposed which

enables around 50 switching loss reduction at all operating power factors thirdly sub fundamental cycle current ripple of a three level inverter is analyzed and a variable switching frequency strategy is presented which helps in 10 20 inverter switching loss reduction

generally large electrolytic capacitors e caps are required to decouple the double line frequency power fluctuation inherent in all the single phase dc ac or ac dc converters these e caps pose the weak link in the pv inverter as they have poor reliability due to short life expectancy and higher esr leading to lower system efficiency in this paper the multi port smart dual inverter modules are proposed for pv string inverter systems which eliminate the requirement of large decoupling capacitors thus leading to more reliable and highly efficient inverter modules the balanced dual outputs are controlled in phase quadrature such that the double frequency current is completely eliminated one of the phases supports the stand alone residential loads and the other phase interfaces to the grid which is synchronized to the utility grid also the proposed modular configuration is scalable to accommodate higher power rating by stacking and paralleling multiple modules simulation results for the dual inverter modules rated for 1 kw each are presented to validate the proposed concept the hardware in the loop based experimental platform is developed and the results will be presented in the final version of the paper
