the rapid development and expansion of based technologies has vast potential implications for the processes of teaching and learning world wide technological advancements of based applications strike at the base of the education spectrum however the scope of experimentation and discussion on this topic has continuously been narrow based education and pedagogical technologies solutions for learning applications provides cutting edge research on such topics as network learning e learning managing based learning and teaching technologies and building based learning communities this innovative book provides researchers practitioners and decision makers in the field of education with essential up to date research in designing more effective learning systems and scenarios using based technologies

this monograph gives a systematic presentation of classical and recent results obtained in the last couple of years it comprehensively describes the methods concerning the topological structure of fixed point sets and solution sets for differential equations and inclusions many of the basic techniques and results recently developed about this theory are presented as well as the literature that is disseminated and scattered in several papers of pioneering researchers who developed the functional analytic framework of this field over the past few decades several examples of applications relating

to initial and boundary value problems are discussed in detail the book is intended to advanced graduate researchers and instructors active in research areas with interests in topological properties of fixed point mappings and applications it also aims to provide students with the necessary understanding of the subject with no deep background material needed this monograph fills the vacuum in the literature regarding the topological structure of fixed point sets and its applications

abstract models for many problems in science and engineering take the form of an operator equation the resolution of these problems often requires determining the existence and uniqueness of solutions to these equations generalized solutions of operator equations and extreme elements presents recently obtained results in the study of the generalized solutions of operator equations and extreme elements in linear topological spaces the presented results offer new methods of identifying these solutions and studying their properties these new methods involve the application of a priori estimations and a general topological approach to construct generalized solutions of linear and nonlinear operator equations the monograph is intended for mathematicians graduate students and researchers studying functional analysis operator theory and the theory of optimal control

differential equations with impulses arise as models of many evolving processes that are subject to abrupt changes such as shocks harvesting and natural disasters these phenomena involve short term perturbations from continuous and smooth dynamics whose duration is negligible in comparison with the duration of an entire evolution in models involving such perturbations it is natural to assume these perturbations act instantaneously or in the form of impulses as a consequence impulsive differential equations have been developed in modeling impulsive problems in physics population dynamics ecology biotechnology industrial robotics pharmacokinetics optimal control and so forth there are also many different studies in biology and medicine for which impulsive differential equations provide good models during the last 10 years the authors have been responsible for extensive contributions to the literature on impulsive differential inclusions via fixed point methods this book is motivated by that research as the authors endeavor to bring under one cover much of those results along with results by other researchers either affecting or affected by the authors work the questions of existence and stability of solutions for different classes of initial value problems for impulsive differential equations and inclusions with fixed and

variable moments are considered in detail attention is also given to boundary value problems in addition since differential equations can be viewed as special cases of differential inclusions significant attention is also given to relative questions concerning differential equations this monograph addresses a variety of side issues that arise from its simpler beginnings as well

the main goal of this book is to present results pertaining to various versions of the maximum principle for elliptic and parabolic systems of arbitrary order in particular the authors present necessary and sufficient conditions for validity of the classical maximum modulus principles for systems of second order and obtain sharp constants in inequalities of miranda agmon type and in many other inequalities of a similar nature somewhat related to this topic are explicit formulas for the norms and the essential norms of boundary integral operators the proofs are based on a unified approach using on one hand representations of the norms of matrix valued integral operators whose target spaces are linear and finite dimensional and on the other hand on solving certain finite dimensional optimization problems this book reflects results obtained by the authors and can be useful to research mathematicians and graduate students interested in partial differential equations
