brazil russia india china and south africa brics are distinguished as having the fast growing  
 markets in the universe compared to other markets of emerging economies according to their  
 promising economic prospective and demographic power this study investigated the effects of  
 government stock on investment activity in brics countries this study used panel autoregressive

distributed lag model, panel engel granger causality test, impulse response functions, irf, and variance decomposition tests. Such techniques were applied to the annual data for the periods 2001 to 2016 in order to determine the effects of government stock on investment activity. The panel showed that in the long run investment activity was positively influenced by government stock on mutual funds and government stock on liquid assets and negatively related to government stock on bonds and government stock on corporations. The engel granger causality test revealed existence of unidirectional movement between investment activity and government stock on corporations as well as from government stock on bonds to liquid assets. The impulse response functions showed the impulse percentage of fluctuation that the variables did contribute to each other from various periods both in the short and long run while the variance decomposition of investment indicated that investment was mainly shocked by its own innovations throughout all the periods. A critical evaluation is needed to avoid investment shocks, instability of investment activity, instability of financial markets and the economy as a whole.
