organized around the latest cacrep standards counseling theory guiding reflective practice by richard d parsons and naijian zhang presents theory as an essential component to both counselor identity formation and professional practice drawing on the contributions of current practitioners the text uses both classical and cutting edge theoretical models of change as lenses for processing client information and developing case conceptualizations and intervention plans each chapter provides a snapshot of a particular theory approach and the major thinkers associated with each theory as well as case illustrations and guided practice exercises to help readers internalize the content presented and apply it to their own development as counselors

remote sounding of the atmosphere has proved to be a fruitful method of obtaining global information about the atmospheres of the earth and other planets this book treats comprehensively the inverse problem of remote sounding and discusses a wide range of retrieval methods for extracting atmospheric parameters of interest from the quantities thermal emission for example that can be measured remotely inverse theory is treated in depth from an estimation theory point of view but practical questions are also emphasized such as designing observing systems to obtain the maximum quantity of information efficient numerical implementation of algorithms for processing large quantities of data error analysis and approaches to the validation of the resulting retrievals the book is targeted at graduate students as well as scientists

this is the third in a series of short books on probability theory and random processes for biomedical engineers this book focuses on standard probability distributions commonly encountered in biomedical engineering the exponential poisson and gaussian distributions are introduced as well as important approximations to the bernoulli pmf and gaussian cdf many important properties of jointly gaussian random variables are presented the primary subjects of the final chapter are methods for determining the probability distribution of a function of a random variable we first evaluate the probability distribution of a function of one random variable using the cdf and then the pdf next the probability distribution for a single random variable is determined from a function of two random variables using the cdf then the joint probability distribution is found from a function of two random variables using the joint pdf and the cdf the aim of all three books is as an introduction to probability theory the audience includes students engineers and researchers presenting applications of this theory to a wide variety of problems as well as pursuing these topics at a more advanced level the theory material is presented in a logical manner developing special mathematical skills as needed the mathematical background required of the reader is basic knowledge of differential calculus pertinent biomedical engineering examples are throughout the text drill problems straightforward exercises designed to reinforce concepts and develop problem solution skills follow most sections
