advances in temporal databases make it increasingly easier to store time dependent information creating a need for facilities that will help end users access this information in the context of natural language interaction significant effort has been devoted to interfaces that allow database queries to be formulated in natural language most of the existing interfaces however do not support adequately the notion of time drawing upon tense and aspect theories temporal logics and temporal databases this cross discipline book examines relevant issues from the three areas developing a unified theoretical framework that can be used to build natural language interfaces to temporal databases the framework features an hpsg mapping from english to a formally defined meaning representation language and a corresponding mapping to a temporal extension of the sql database language the book is accompanied by a freely available prototype interface built according to the framework and implemented using prolog and ale this is the first in depth

exploration of the notion of time in natural language database interfaces it will be particularly interesting to researchers working on natural language interaction tense and aspect hpsg temporal logics and temporal databases especially those who wish to learn about time related issues in other disciplines

the central theme of this book is the study of rational points on algebraic varieties of fano and intermediate type both in terms of when such points exist and if they do their quantitative density the book consists of three parts in the first part the author discusses the concept of a height and formulates manin's conjecture on the asymptotics of rational points on fano varieties the second part introduces the various versions of the brauer group the author explains why a brauer class may serve as an obstruction to weak approximation or even to the hasse principle this part includes two sections devoted to explicit computations of the brauer manin obstruction for particular types of cubic surfaces the final part describes numerical experiments related to the manin conjecture that were carried out by the author together with andreas stephan elsenhans the book presents the state of the art in computational arithmetic geometry for higher dimensional algebraic varieties and will be a valuable reference for researchers and graduate students interested in that area

parallel computations focuses on parallel computation with emphasis on algorithms used in a variety of numerical and physical applications and for many different types of parallel computers topics covered range from vectorization of fast fourier transforms ffts and of the incomplete cholesky conjugate gradient iccg algorithm on the cray 1 to calculation of table lookups and piecewise functions single tridiagonal linear systems and vectorized computation of reactive flow are also discussed comprised of 13 chapters this volume begins by classifying parallel computers and describing techniques for performing matrix operations on them the reader is then introduced to ffts and the tridiagonal linear system as well as the iccg method different versions of the conjugate gradient method for solving the time dependent diffusion equation are considered subsequent chapters deal with two and three dimensional fluid flow calculations paying particular attention to the principal issues in designing efficient numerical methods for hydrodynamic calculations the decisions that a numerical modeler must make to optimize chemically reactive flow simulations and how to handle disk to core data transfer and storage allocation for the solution of the implicit equations for three dimensional flows the book also describes the time split finite difference scheme for solving the two dimensional navier stokes equation for flows through slotted nozzles finally the large scale stimulation of plasmas as carried out on a small computer with an array processor is discussed
