it has been obvious to those of us in behavioral analysis that many of the problems of business and industry could be analyzed in terms of the management of behavior what was needed was the use of a knowledge of behavior analysis to develop effective personnel incentive systems not only was is obvious to dale and karen brethower but they and some of their colleagues have actually been doing it for the last few years the

results of their work are presented in this text it should be emphasized that the approach presented in this book is a general one it is just as applicable to the management of behavior in education health and government institutions etc as in business and industry a total performance system is a functional combination of systems analysis and feedback systems like behavioral analysis the total performance system approach has an extremely wide range of applications both within and outside the areas of business and industry

everyone is familiar with the amazing performance of a modern smartphone powered by a billion plus nanotransistors each having an active region that is barely a few hundred atoms long the same amazing technology has also led to a deeper understanding of the nature of current flow and heat dissipation on an atomic scale which is of broad relevance to the general problems of non equilibrium statistical mechanics that pervade many different fields this book is based on a set of two online courses originally offered in 2012 on nanohub u and more recently in 2015 on edx in preparing the second edition the author decided to split it into parts a and b titled basic concepts and quantum transport respectively along the lines of the two courses a list of available video lectures corresponding to different sections of this volume is provided upfront to make these lectures accessible to anyone in any branch of science or engineering the author assume very little background beyond linear algebra and differential equations however the author will be discussing advanced concepts that should be of interest even to specialists who are encouraged to look at his earlier books for additional technical details

this book presents a fascinating and self contained account of recruitment learning a model and theory of fast learning in the neocortex in contrast to the more common attractor network paradigm for long and short term memory recruitment learning focuses on one shot learning or chunking of arbitrary feature conjunctions that co occur in single presentations the book starts with a comprehensive review of the historic background of recruitment learning putting special emphasis on the ground breaking work of d o hebb w a wickelgren j a feldman l g valiant and l shastri afterwards a thorough mathematical analysis of the model is presented which shows that recruitment is indeed a plausible mechanism of memory formation in the neocortex a third part extends the main concepts towards state of the art spiking neuron models and dynamic synchronization as a tentative solution of the binding problem the book further discusses the possible role of adult neurogenesis for recruitment these recent developments put the theory of recruitment learning at the forefront of research on biologically inspired memory models and make the book an important and timely contribution to the field
