the main focus of this monograph is to offer a comprehensive presentation of known and new results on various generalizations of cs modules and cs rings extending or cs modules are generalizations of injective and also semisimple or uniform modules while the theory of cs modules is well documented in monographs and textbooks results on generalized forms of the cs property as well as dual notions are far less present in the literature with their work the authors provide a solid background to module theory

accessible to anyone familiar with basic abstract algebra the focus of the book is on direct sums of cs modules and classes of modules related to cs modules such as relative injective ejective modules quasi continuous modules and lifting modules in particular matrix cs rings are studied and clear proofs of fundamental decomposition results on cs modules over commutative domains are given thus complementing existing monographs in this area open problems round out the work and establish the basis for further developments in the field the main text is complemented by a wealth of examples and exercises

extending modules are generalizations of injective modules and dually lifting modules generalize projective supplemented modules there is a certain asymmetry in this duality while the theory of extending modules is well documented in monographs and text books the purpose of our monograph is to provide a thorough study of supplements and projectivity conditions needed to investigate classes of modules related to lifting modules the text begins with an introduction to small submodules the radical variations on projectivity and hollow dimension the subsequent chapters consider preradicals and torsion theories in particular related to small modules decompositions of modules including the exchange property and local semi t nilpotency supplements in modules with specific emphasis on semilocal endomorphism rings finishing with a long chapter on lifting modules leading up their use in the theory of perfect rings harada rings and quasi frobenius rings most of the material in the monograph appears in book form for the first time the main text is augmented by a plentiful supply of exercises together with comments on further related material and on how the theory has evolved

this book is an introduction to module theory for the reader who knows something about linear algebra and ring theory its main aim is the derivation of the structure theory of modules over euclidean domains this theory is applied to obtain the structure of abelian groups and the rational canonical and jordan normal forms of matrices the basic facts about rings and modules are given in full generality so that some further topics can be discussed including projective modules and the connection between modules and representations of groups the book is intended to serve as supplementary reading for the third or fourth year undergraduate who is taking a course in module theory the further topics point the way to some projects that might be attempted in conjunction with a taught course

the theory of d modules is a rich area of study combining ideas from algebra and differential equations and it has significant applications to diverse areas

such as singularity theory and representation theory this book introduces D modules and their applications avoiding all unnecessary technicalities the author takes an algebraic approach concentrating on the role of the Weyl algebra the author assumes very few prerequisites and the book is virtually self contained the author includes exercises at the end of each chapter and gives the reader ample references to the more advanced literature this is an excellent introduction to D modules for all who are new to this area

the original title of this work translated as foundation of algebraic analysis kashiwara kyoto u japan changed the title to more precisely reflect the nature of the text's contents and to signal his belief that the microlocal point of view helps concrete calculations as powerfully as the Cauchy integral formula provides the values of many definite integrals chapters cover basic properties of D modules characteristic varieties construction of D modules their functorial properties regular holonomic systems b functions ring of formal microdifferential operators microlocal analysis of holonomic systems and microlocal calculus of b functions translated from the Japanese work daisu kaiseki gairon 2000 annotation copyrighted by book news inc portland or

this book provides a comprehensive exposition of the use of set theoretic methods in abelian group theory module theory and homological algebra including applications to Whitehead's problem the structure of Ext and the existence of almost free modules over non perfect rings this second edition is completely revised and updated to include major developments in the decade since the first edition among these are applications to cotorsion theories and covers including a proof of the flat cover conjecture as well as the use of Shelah's pcf theory to construct almost free groups as with the first edition the book is largely self contained and designed to be accessible to both graduate students and researchers in both algebra and logic they will find there an introduction to powerful techniques which they may find useful in their own work

a collection of articles embodying the work presented at the 1991 methods in module theory conference at the university of Colorado at Colorado Springs facilitating the explanation and cross fertilization of new techniques that were developed to answer a variety of module theoretic questions

D modules continues to be an active area of stimulating research in such mathematical areas as algebraic analysis differential equations and representation theory key to D modules perverse sheaves and representation theory is the author's essential algebraic analytic approach to

the theory which connects d modules to representation theory and other areas of mathematics to further aid the reader and to make the work as self contained as possible appendices are provided as background for the theory of derived categories and algebraic varieties the book is intended to serve graduate students in a classroom setting and as self study for researchers in algebraic geometry representation theory
