an ecohydrological ecosystem contains numerous waters soil and vegetation precipitation moves through the canopy layers washes through the vegetation infiltrates the soil organic horizon and percolates downward through the deeper

mineral soil to the groundwater at multi scales vegetation management i.e changing land use types and patterns can alter hydrological cycles and thereby impact the provisioning of ecosystem services for example vegetation management practices can impact ecosystem fluxes such as runoff evapotranspiration soil storage and nutrients recent developments in distributed modeling of ecohydrological processes have enabled us to better understand how vegetation management practices change in relation to hydrological and geochemical cycles overall understanding the interactions between the ecohydrological ecosystem and hydrological and geochemical processes is crucial for supporting decision making in eco construction and the efficient use of water resources
