this book equips dental care providers with a thorough understanding of the emerging therapies that promise to revolutionize the clinical management of periodontal diseases existing therapies targeted to the oral microbiome alone often fail to provide favorable clinical outcomes local inflammation and tissue destruction may persist and periodontal tissue regeneration is not predictably achieved in recognition of these shortcomings current research efforts are focused on understanding the biological interactions between the host and the resident microbiome and identifying key molecules and molecular pathways that can be used for more targeted individualized therapies that will restrain oral inflammation and restore periodontal tissue homeostasis this book introduces novel concepts and molecules that are currently being tested in preclinical and clinical models readers will find detailed information from leading experts on specific therapeutic strategies targeting the host immune and inflammatory system the oral microbiome and regeneration

periodontics is a dental specialty that encompasses the prevention diagnosis and treatment of diseases affecting the supporting and surrounding tissues of the teeth ie periodontal tissues or their substitutes such as dental implants ie peri implant tissues and is also concerned with the maintenance of the health function and aesthetics of these structures and tissues periodontal diseases are multifactorial infectious diseases wherein the presence of

periodontopathogenic species seems to play a key role in the etiopathogenesis and results in a progressive loss of the hard and soft tissue around the teeth which if left untreated ultimately leads to the loosening and subsequent loss of teeth similarly diseases affecting peri implant tissues if not managed and treated properly results in an implant failure however the nature and severity of periodontal and peri implant diseases depend on the patients oral hygiene interaction between the bacterial agent the environment and the host defence mechanisms and the presence of various risk elements for periodontal peri implant diseases like genetic factors diabetes smoking etc periodontal disease itself can also act as a potential risk factor for several systemic conditions and may significantly enhance the probability for certain systemic diseases or alter their natural course fortunately periodontal and peri implant diseases are largely preventable and treatable conditions and their successful long term management and treatment requires a treatment strategy that integrates non surgical surgical and supportive periodontal peri implant therapy along with patient motivation and reinforcement of excellent oral hygiene measures
