this volume contains the technical papers presented at the international symposium entitled processing and fabrication of advanced materials viii held in singapore in 1999 this was the eighth in a series of symposia bringing together engineers and researchers from industry academia and national laboratories working on aspects related to the processing fabrication and characterization of advanced materials to present and discuss their latest findings the proceedings also contain technical papers presented at two special symposia on biomaterials and magnesium technology

different physical models for the snoek type relaxation in ternary systems fe c me are analyzed from the viewpoint of a distance of interatomic interaction taken into account for non saturated from the viewpoint of overlapping of interatomic interaction in b c c alloys the physically sufficient and optimal for the computer simulation is the short range model which takes into account the interatomic interaction and the

average amount of substitutional atoms in the first coordination shell only for high alloyed bcc systems i.e. with the overlapped interatomic interaction the carbon atom undergoes an interaction of a few substitutional atoms simultaneously that leads to the appearance of one broadened Snoek peak. Activation energy of such a peak is summed from the elastic and chemical interatomic interactions. Experimental results for alloys with bcc solid solution structure and its computer simulations allow to introduce the new criterion for the high alloy state of monophase steels. The high alloyed state corresponds to the situation when substitutional atoms can not be considered any longer as the isolated atoms from the viewpoint of mechanical spectroscopy. This situation corresponds to the appearance of one broadened Snoek type peak instead of two peaks existed for the steels with lower substitutional atom concentration.
