the automotive lubricants arena has undergone significant changes since the first edition of this book was published in 1996 environmental concerns particularly regarding improvement of air quality have been important in recent years reduced emissions are directly related to changes in lubricant specifications and quality and the second edition of the automotive lubricants reference book reflects the urgency of such matters by including updated and expanded detail this second edition also considers the recent phenomenon of increased consolidation within the oil and petroleum additive arenas which has resulted in fewer people for research development and implementation along with fewer competing companies after reviewing the first edition the authors have fully reviewed and updated the information to fit in with the changes in technology and markets chapters include introduction and fundamentals constituents of modern lubricants crankcase oil testing crankcase oil quality levels and formulations practical experiences with lubricant problems performance levels classification specification and approval of engine lubricants other lubricants for road vehicles other specialized oils of interest blending storage purchase and use safety health and the environment the future

the trace formula is the most powerful tool currently available to establish liftings of automorphic forms as predicted by langlands principle of functionality the geometric part of the trace formula consists of orbital integrals and the lifting is based on the fundamental lemma the latter is an identity of the relevant orbital integrals for the unit elements of the hecke algebras this volume concerns a proof of the fundamental lemma in the classically most interesting case of siegel modular forms namely the symplectic group $sp(2)$ these orbital integrals are compared with those on $gl(4)$ twisted by the transpose inverse involution the technique of proof is

elementary compact elements are decomposed into their absolutely semi simple and topologically unipotent parts also in the twisted case a double coset decomposition of the form $h g k$ where h is a subgroup containing the centralizer plays a key role

quantum process algebra introduces readers to the algebraic properties and laws for quantum computing the book provides readers with all aspects of algebraic theory for quantum computing including the basis of semantics and axiomatization for quantum computing with the assumption of a quantum system readers will learn to solve the modelling of the three main components in a quantum system unitary operator quantum measurement and quantum entanglement with full support of quantum and classical computing in closed systems next the book establishes the relationship between probabilistic quantum bisimilarity and classical probabilistic bisimilarity including strong probabilistic bisimilarity and weak probabilistic bisimilarity which makes an axiomatization of quantum processes possible with this framework quantum and classical computing mixed processes are unified with the same structured operational semantics finally the book establishes a series of axiomatizations of quantum process algebras these process algebras support nearly all main computation properties quantum and classical computing in closed quantum systems are unified with the same equational logic and the same structured operational semantics under the framework of acp like probabilistic process algebra this unification means that the mathematics in the book can be used widely for verification of quantum and classical computing mixed systems for example most quantum communication protocols acp like axiomatization also inherits the advantages of acp for example and modularity means that it can be extended in an elegant way provides readers with an introduction to the algebraic properties and laws relevant to quantum computing shows how quantum and classical computing mixed processes are unified with the same structured operational semantics through the framework of quantum process configuration establishes a series of axiomatizations of quantum process algebras
