over the past two decades academic economics has undergone a mild revolution in

methodology the language concepts and techniques of noncooperative game theory have become central to the discipline this book provides the reader with some basic concepts from noncooperative theory and then goes on to explore the strengths weaknesses and future of the theory as a tool of economic modelling and analysis the central theses are that noncooperative game theory has been a remarkably popular tool in economics over the past decade because it allows analysts to capture essential features of dynamic competition and competition where some parties have proprietary information the theory is weakest in providing a sense of when it and equilibrium analysis in particular can be applied and what to do when equilibrium analysis is inappropriate many of these weaknesses can be addressed by the consideration of individuals who are boundedly rational and learn imperfectly from the past written in a non technical style and working by analogy the book first given as part of the clarendon lectures in economics is readily accessible to a broad audience and will be of interest to economists and students alike knowledge of game theory is not required as the concepts are developed as the book progresses

volume ii of microeconomic foundations introduces models and methods at the center of modern microeconomic theory in this textbook david kreps a leading economic theorist emphasizes foundational material concentrating on seminal work that provides perspective on how and why the theory developed because noncooperative game theory is the chief tool of modeling and analyzing microeconomic phenomena the book stresses the applications of game theory to economics and throughout it underscores why theory is most useful when it supports rather than supplants economic intuition introduces first year graduate students to the models and methods at the core of microeconomic theory today covers an extensive range of topics including the agency theory market signaling relational contracting bilateral bargaining auctions matching markets and mechanism design stresses the use and misuse of theory in studying economic phenomena and shows why theory should support not replace economic intuition includes extensive appendices reviewing the essential concepts of noncooperative game theory with guidance about how it should and shouldn t be used features free online supplements including chapter outlines and overviews solutions to all the problems in the book and more

mainstream economics considers individual preferences to be fixed and unchanging although psychologists and other social scientists explore how tastes are formed influenced and evolve it is not considered proper in orthodox economics to do so arguing about tastes makes the case that economists should abandon the principle that preferences are fixed and instead incorporate into their work how context and experience shape individual tastes david m kreps argues that the discipline must account for dynamic personal tastes when it comes to understanding social exchange emphasizing human resource management and on the job behavior he develops formal models that illustrate the power of intrinsic motivation and show why applying extrinsic incentives can be counterproductive kreps weighs the advantages and disadvantages of the principle *de gustibus non est disputandum* there is no arguing about tastes he calls for a new era of economics in which preferences are taken into account and not for

granted arguing about tastes concludes with responses by the distinguished economists alessandra casella and joseph e stiglitiz and a final reply by kreps

in the half century since world war ii american academic culture has changed profoundly academic figures who have helped to produce many of these changes explore how four disciplines in the social sciences and humanities political science economics philosophy and literary studies have been transformed the book compares the different paths these disciplines have followed and the consequent alterations in their relations to the larger public

the author examines the interplay between evolutionary game theory and the equilibrium selection problem in noncooperative games evolutionary game theory is one of the most active and rapidly growing areas of research in economics unlike traditional game theory models which assume that all players are fully rational and have complete knowledge of details of the game evolutionary models assume that people choose their strategies through a trial and error learning process in which they gradually discover that some strategies work better than others in games that are repeated many times low payoff strategies tend to be weeded out and an equilibrium may emerge larry samuelson has been one of the main contributors to the evolutionary game theory literature in evolutionary games and equilibrium selection he examines the interplay between evolutionary game theory and the equilibrium selection problem in noncooperative games after providing an overview of the basic issues of game theory and a presentation of the basic models the book addresses evolutionary stability the dynamics of sample paths the ultimatum game drift noise backward and forward induction and strict nash equilibria

leading economists presenting fundamentally important issues in economic theory is the theme of the nancy schwartz lectures series held annually at the j l kellogg graduate school of management of northwestern university reporting on lectures delivered in the years 1983 through 1997 this collection of essays discusses economic behavior at the individual and group level and the implications to the performance of economic systems using non technical language the speakers present theoretical experimental and empirical analysis of decision making under uncertainty and under full and bounded rationality the influence of economic incentives and habits and the effects of learning and evolution on dynamic choice perfect competition economic development social insurance and social mobility and negotiation and economic survival are major economic subjects analyzed through our understanding of economic behavior

developed over a ten year period at the stanford business school this textbook underscores the connections between microeconomics and business its full length

integrated case studies reveal how economic models can yield answers to practical problems

david m kreps has developed a text in microeconomics that is both challenging and user friendly the work is designed for the first year graduate microeconomic theory course and is accessible to advanced undergraduates as well placing unusual emphasis on modern noncooperative game theory it provides the student and instructor with a unified treatment of modern microeconomic theory one that stresses the behavior of the individual actor consumer or firm in various institutional settings the author has taken special pains to explore the fundamental assumptions of the theories and techniques studied pointing out both strengths and weaknesses the book begins with an exposition of the standard models of choice and the market with extra attention paid to choice under uncertainty and dynamic choice general and partial equilibrium approaches are blended so that the student sees these approaches as points along a continuum the work then turns to more modern developments readers are introduced to noncooperative game theory and shown how to model games and determine solution concepts models with incomplete information the folk theorem and reputation and bilateral bargaining are covered in depth information economics is explored next a closing discussion concerns firms as organizations and gives readers a taste of transaction cost economics

three themes are brought together in this volume innovative activity managerial performance in the organization of innovations and markets for ownership and control in consideration of these themes several specific questions are raised

i began this monograph which at the time was a nascent paper with the objective of understanding how and how well continuous time models of economic phenomena and in particular models that employ brownian motion relate to near by discrete time models we know by examples that the connections are sometimes not altogether obvious see for instance fudenberg and levine 2009 and sadzik and stacchetti 2015 so it seemed to me a general theory connecting the two types of models ought to be available
