until now information on the dynamic loading of structures has been widely scattered no other book has examined the different types of loading in a comprehensive and systematic manner and looked at their significance in the design process the book begins with a survey of the probabilistic background to all forms of loads which is particularly important to dynamic loads and then looks at the main types in turn wind earthquake wave blast and impact loading the relevant code provisions eurocode and ubc american are detailed and a number of examples are used to illustrate the principles a final section covers the analysis for dynamic loading drawing out the concepts underlying the treatment of all dynamic loads and the corresponding modelling techniques throughout there is a focus on the modelling of structures rather than on classical structural dynamics

this book highlights the applications of data mining technologies in structural dynamic analysis including structural design optimization parameter identification model updating damage identification in civil mechanical and aerospace engineering these engineering applications require precise structural design fabrication inspection and further monitoring to obtain a full life cycle analysis and by focusing on data processing data mining technologies offer another aspect in structural dynamic analysis discussing techniques in time frequency domain such as hilbert transforms wavelet theory and machine learning for structural dynamic analysis to help in structural monitoring and diagnosis the book is an essential reference resource for beginners graduates and industrial professionals in various fields
