the biological sciences cover a broad array of literature types from younger fields like molecular biology with its reliance on recent journal articles
genomic databases and protocol manuals to classic fields such as taxonomy with its scattered literature found in monographs and journals from the past

three centuries using the biological literature a practical guide fourth edition is an annotated guide to selected resources in the biological sciences presenting a wide ranging list of important sources this completely revised edition contains numerous new resources and descriptions of all entries including textbooks the guide emphasizes current materials in the english language and includes retrospective references for historical perspective and to provide access to the taxonomic literature it covers both print and electronic resources including monographs journals databases indexes and abstracting tools websites and associations providing users with listings of authoritative informational resources of both classical and recently published works with chapters devoted to each of the main fields in the basic biological sciences this book offers a guide to the best and most up to date resources in biology it is appropriate for anyone interested in searching the biological literature from undergraduate students to faculty researchers and librarians the guide includes a supplementary website dedicated to keeping urls of electronic and web based resources up to date a popular feature continued from the third edition

presenting specialized biological information on what cancer is this book looks at how it damages the body and how cancer treatments work engaging accessible and illustrated throughout this unique text explains the basic biology of cancer discusses the biology of the wide range of common cancers identifies and explains the biological causes of cancer explains drug action in chemotherapy and analgesia explains the link between diet and cancer and how diet is important in cancer therapy discusses the biological basis of a range of nursing skills linked to cancer providing nurses with the essential knowledge required for working with cancer patients and their families this book will enable them to work with current and new forms of cancer treatment

this book explores current research on young children s beliefs and knowledge about the biological world otherwise known as folkbiology contributors discuss factors that shape the development of folkbiological knowledge as well as possible interventions designed to counteract cognitive biases that can interfere with the development of scientifically informed reasoning about natural phenomena taken together the papers provide insights into the contributions of cognitive biases to the development of biological misunderstandings and into the life experiences and contexts that can contribute to or impede accurate learning of biological concepts as part of a wider literature the insights provided by the authors are relevant to the design of educational experiences that will foster children s exploration and further their understanding of life science ideas the chapters in this book were originally published as a special issue of early education and development

analytic metaphysics has recently discovered biology as a means of grounding metaphysical theories this has resulted in long standing metaphysical puzzles such as the problems of personal identity and material constitution being increasingly addressed by appeal to a biological understanding of identity this development within metaphysics is in significant tension with the growing tendency amongst philosophers of biology to regard biological

identity as a deep puzzle in its own right especially following recent advances in our understanding of symbiosis the evolution of multi cellular organisms and the inherently dynamical character of living systems moreover and building on these biological insights the broadly substance ontological framework of metaphysical theories of biological identity appears problematic to a growing number of philosophers of biology who invoke process ontology instead this volume addresses this tension exploring to what extent it can be dissolved for this purpose the volume presents the first selection of essays exclusively focused on biological identity and written by experts in metaphysics the philosophy of biology and biology the resulting cross disciplinary dialogue paves the way for a convincing account of biological identity that is both metaphysically constructive and scientifically informed and will be of interest to metaphysicians philosophers of biology and theoretical biologists

biological control of weeds has been practiced for over 100 years and australia has been a leader in this weed management technique the classical example of control of prickly pears in australia by the cactus moth *cactoblastis cactorum* which was imported from the americas helped to set the future for biocontrol of weeds in many countries since then there have been many projects using classical biological control to manage numerous weed species many of which have been successful importantly there have been no serious negative non target impacts the technique when practiced as it is in australia is safe and environmentally friendly economic assessments have shown that biocontrol of weeds in australia has provided exceedingly high benefit to cost ratios this book reviews biological control of weeds in australia to 2011 covering over 90 weed species and a multitude of biological control agents and potential agents each chapter has been written by practicing biological control of weeds researchers and provides details of the weed the history of its biological control exploration for agents potential agents studied and agents released and the outcomes of those releases many weeds were successfully controlled some were not many projects are still underway some have just begun however all are reported in detail in this book biological control of weeds in australia will provide invaluable information for biological control researchers in australia and elsewhere agents used in australia could be of immense value to other countries that suffer from the same weeds as australia the studies reported here provide direction to future research and provide examples and knowledge for researchers and students key features a unique collation of information for australian weed research and management contains all the information about biological control of weeds in australia in one book provides key references for further information will become a well cited publication

the previous volume the pathogenesis of alcoholism psychosocial factors attempted to describe the interaction of biological psychological and social factors that lead to the initiation and perpetuation of alcoholism the preface to that volume presented our particular view of the bio psycho social interaction as a progressive process in which earlier developments produce new pathogenetic mechanisms which in turn lead to still other cyclical feedback activities although influences from each of the three phenomenologic levels are at work during each stage of the clinical course it would appear that social factors are most significant in the early phase psychological factors at the intermediate level and biological ones toward the end these differences are only relative however for influences of all three types surely are operative during all stages of the syndrome this appears to be

particularly true for the biological parameters of activity don goodwin 1976 who has supplied much of the data that support the role of hereditary factors in alcoholism is wont to say that all living behavior is biological by definition the operational evidence for this is perhaps more evident in alcoholism than in other syndromes for example the general social indifference of many asians to alcohol may reflect the presence of an atypical isoenzyme of alcohol dehydrogenase rather than some independently derived cultural norm

the view of nature as red in tooth and claw as a jungle in which competition and predation are the predominant themes has long been important in both the scientific and popular literature however in the past decade another view has become widespread among ecologists the idea that mutualisms mutually beneficial interactions between species are just as important as competition and predation this book is one of the first to explore this theme ideas and theories applicable to all sorts of mutualisms are presented and where appropriate examined in the light of concrete data themes explored include the organisms involved both animal and plant how specializations evolved once mutualisms formed how mutualisms affect population dynamics and community structure and the role of mutualisms in different environments the book will be of special interest to ecologists and a wide range of biologists

we are all the result of gestation the process of becoming before birth the very nature of human gestation however has shifted and will continue to shift as a result of technology uterus transplantation and ectogestation and the novel modalities of gestation beyond sex and beyond bodies that they potentially make possible raise unique conceptual problems that have received little attention biotechnology gestation and the law presents the first comprehensive ethico legal analysis of the nature of gestation and of technologies enabling gestation offering a concept analysis grounded in ontology phenomenology politics and law the first three chapters develop a transdisciplinary approach for identifying and exploring the ethical issues raised by uterus transplantation and ectogestation this addresses the ontological and legal confusion about what gestation is how we should classify procreative technologies in relation to gestation and why it is important to have precise classification the remaining chapters use this framework to undertake a rigorous examination of pressing socio legal implications of uterus transplantation and ectogestation who has access to technologies enabling gestation and under what circumstances who is are the parent s when novel forms of gestation are used how do these technologies disrupt our notions of reproductive biosex and are they tools of emancipation from gendered roles this book and the original conceptual lens it sets out forges a new direction for legal and social reform directed at addressing the harms of constructed gendered procreative and parenting roles in speculating about future possibilities elizabeth chloe romanis brings visibility to the oppressive propagation of biological essentialism that underpins the contemporary regulation of human procreation and considers how to address this issue now and into the future

it is becoming more relevant to explore soil biological processes in terms of their contribution to soil fertility this book presents a comprehensive scientific overview of the components and processes that underpin the biological characteristics of soil fertility it highlights the enormous diversity of

life in soil and the resulting effects that management of land can have on the contribution of this diverse community to soil fertility in an agricultural context

this volume presents an interconnected set of sixteen essays four of which are previously unpublished by allan gotthelf one of the leading experts in the study of aristotle s biological writings gotthelf addresses three main topics across aristotle s three main biological treatises starting with his own ground breaking study of aristotle s natural teleology and its illuminating relationship with the generation of animals gotthelf proceeds to the axiomatic structure of biological explanation and the first principles such explanation proceeds from in the parts of animals after an exploration of the implications of these two treatises for our understanding of aristotle s metaphysics gotthelf examines important aspects of the method by which aristotle organizes his data in the history of animals to make possible such a systematic explanatory study of animals offering a new view of the place of classification in that enterprise in a concluding section on aristotle as theoretical biologist gotthelf explores the basis of charles darwin s great praise of aristotle and in the first printing of a lecture delivered worldwide provides an overview of aristotle as a philosophically oriented scientist and a proper verdict on his greatness as scientist

invasive species have a critical and growing effect upon natural areas they can modify degrade or destroy wildland ecosystem structure and function and reduce native biodiversity landscape level solutions are needed to address these problems conservation biologists seek to limit such damage and restore ecosystems using a variety of approaches one such approach is biological control the deliberate importation and establishment of specialized natural enemies which can address invasive species problems and which should be considered as a possible component of restoration biological control can be an effective tool against many invasive insects and plants but it has rarely been successfully employed against other groups safety is of paramount concern and requires that the natural enemies used be specialized and that targeted pests be drivers of ecological degradation while modern approaches allow species to be selected with a high level of security some risks do remain however as in all species introductions these should be viewed in the context of the risk of failing to reduce the impact of the invasive species this unique book identifies the balance among these factors to show how biological control can be integrated into ecosystem restoration as practiced by conservation biologists jointly developed by conservation biologists and biological control scientists it contains chapters on matching tools to management goals tools in action measuring and evaluating ecological outcomes of biological control introductions managing conflict over biological control and includes case studies as well as an ethical framework for integrating biological control and conservation practice integrating biological control into conservation practice is suitable for graduate courses in invasive species management and biological control as well as for research scientists in government and non profit conservation organizations
