the problem of the long term proliferation of cells is a seminal one it has always been a hot subject in biology a source of far reaching hypotheses even more so now when explanations for the mechanisms of cell proliferative mortality or immortality seem within our reach a question which is still debated is whether an infinite division potential can be a normal trait or is always the result of modifications leading to abnormal cell growth and escape from homeostasis in general investigators have been advocates of one of the two extremes universal limited or unlimited normal proliferative potential since the long term proliferative potential of cells concerns regulation of development regeneration of tissues and homeostatic control of cell growth in brief survival of living organisms and since the regulation of these processes is so different along the evolutionary scale it is not surprising that there does not seem to be any universal trait the question of whether cells are endowed with finite or infinite proliferative phenotypes has to be seen using the perspective of comparative biology
