from the viewpoint of a health economist the intensive care unit leu is a particularly fascinating phenomenon it is the epitome of high tech medicine and frequently portrayed as the place where life saving miracles are routinely wrought but the popular imagination is also caught up in the darker side when agonizing decisions have to be made to avoid futile and inhuman continuation of expensive treatments my analytical interests led me to approach these issues by asking what the evidence tells us about which leu activities are very beneficial in

relationship to their costs and which are not this quickly translates into a slightly different question namely which patients are most appropriately treated in an ICU and which not unfortunately it is very hard to answer these questions because it has proved very difficult to investigate these issues in the manner which is now regarded as the gold standard namely by conducting randomized clinical trials or alternative courses of action i think this is a pity and i am not at all convinced that it would be unethical to do so in many cases because there is wide variation in practice and genuine doubt as to which practices are best the two conditions that need to be fulfilled before such a trial is justifiable
