analysis of categorical data with r second edition presents a modern account of categorical data analysis using the r software environment it covers recent techniques of model building and assessment for binary multicategory and count response variables and discusses fundamentals such as odds ratio and probability estimation the authors give detailed advice and guidelines on which procedures to use and why to use them the second edition is a substantial update of the first based on the authors experiences of teaching from the book for nearly a decade the book is organized as before but with new content throughout and there are two new substantive topics in the advanced topics chapter group testing and splines the computing has been completely

updated with the emmeans package now integrated into the book the examples have also been updated notably to include new examples based on covid 19 and there are more than 90 new exercises in the book the solutions manual and teaching videos have also been updated features requires no prior experience with r and offers an introduction to the essential features and functions of r includes numerous examples from medicine psychology sports ecology and many other areas integrates extensive r code and output graphically demonstrates many of the features and properties of various analysis methods offers a substantial number of exercises in all chapters enabling use as a course text or for self study supplemented by a website with data sets code and teaching videos analysis of categorical data with r second edition is primarily designed for a course on categorical data analysis taught at the advanced undergraduate or graduate level such a course could be taught in a statistics or biostatistics department or within mathematics psychology social science ecology or another quantitative discipline it could also be used by a self learner and would make an ideal reference for a researcher from any discipline where categorical data arise

this book provides a comprehensive introduction to methods and models for categorical data analysis and their applications in social science research companion website also available at [web.space.utexas.edu/dpowers](http://web.space.utexas.edu/dpowers)

categorical data comprising counts of individuals objects or entities in different categories emerge frequently from many areas of study including medicine sociology geology and education they provide important statistical information that can lead to real life conclusions and the discovery of fresh knowledge therefore the ability to manipulate understand and interpret categorical data becomes of interest if not essential to professionals and students in a broad range of disciplines although t tests linear regression and analysis of variance are useful valid methods for analysis of measurement data categorical data requires a different methodology and techniques typically not encountered in introductory statistics courses developed from long experience in teaching categorical analysis to a multidisciplinary mix of undergraduate and graduate students a course in categorical data analysis presents the easiest most straightforward ways of extracting real life conclusions from contingency tables the author uses a fisherian approach to categorical data analysis and incorporates numerous examples and real data sets although he offers s plus routines through the internet readers do not need full knowledge of a statistical software package in this unique text the author chooses methods and an approach that nurtures intuitive thinking he trains his readers to focus not on finding a model that fits the data but on using different models that may lead to meaningful conclusions the book offers some simple innovative techniques not highlighted in other texts that help make the book accessible to a broad interdisciplinary audience a course in categorical data analysis enables readers to quickly use its offering of tools for drawing scientific medical or real life conclusions from categorical data sets

the aim of this book is to give an up to date account of the most commonly used statistical models for categorical data the emphasis is on the connection between theory and applications to real data sets the book only covers models for categorical data various models for mixed continuous and categorical data are thus excluded the book is written as a textbook although many methods and results are quite recent this should imply that the book can be used for a graduate course in categorical data analysis with this aim in mind chapters 3 to 12 are concluded with a set of exercises in many cases the data sets are those data sets which were not included in the examples of the book although they at one point in time were regarded as potential candidates for an example a certain amount of general knowledge of statistical theory is necessary to fully benefit from the book a summary of the basic statistical concepts deemed necessary prerequisites is given in chapter 2 the mathematical level is only moderately high but the account in chapter 3 of basic properties of exponential families and the parametric multinomial

distribution is made as mathematical precise as possible without going into mathematical details and leaving out most proofs
