master s thesis from the year 2014 in the subject computer science applied grade 82 00 course m tech cs e language english abstract hadoop and map reduce today are facing huge amounts of data and are moving towards ubiquitous for big data storage and processing this has made it an essential feature to evaluate and characterize the hadoop file system and its deployment through extensive benchmarking we have other benchmarking tools widely available with us today that are capable of analyzing the performance of

the hadoop system but they are made to either run in a single node system or are created for assessing the storage device that is attached and its basic characteristics as top speed and other hardware related details or manufacturer s details for this the tool used is hibench that is an essential part of hadoop and is comprehensive benchmark suit that consist of a complete deposit of hadoop applications having micro bench marks real time applications for the purpose of benchmarking the performance of hadoop on the available type of storage device i e hdd and ssd and machine configuration this is helpful to optimize the performance and improve the support towards the limitations of hadoop system in this research work we will analyze and characterize the performance of external sorting algorithm in hadoop mapreduce with ssd and hdd that are connected with various interconnect technologies like 10gige ipoib and rdbaib in addition we will also demonstrate that the traditional servers and old cloud systems can be upgraded by software and hardware up gradations to perform at par with the modern technologies to handle these loads without spending ruthlessly on up gradations or complete changes in the system with the use of modern storage devices and interconnect networking systems this in turn reduces the power consumption drastically and allows smoother running of large scale servers with low latency and high throughput allowing use of the utmost power of the processors for the big data flowing in the network

transformations in wireless connectivity and location aware technologies hold the promise of bringing a sea change in the way transportation information is generated and used in the future sensors in the transportation system when integrated with those in other sectors for example energy utility and health have the potential to foster novel new ways of improving livability and sustainability the end result of these developments has been somewhat contradictory although automation in the transportation environment has become

increasingly widespread the level of involvement and active participation by people in terms of co creation and contribution of information has also increased as a result the following two major trends have been observed 1 increases in machine to machine m2m communications and 2 increases in the variety and volume of user generated content in this transportation paradigm the pervasive use of information and communication technologies will serve as the foundation for mobility intelligence towards an ubiquitous information centered mobility environment however many technical and operational questions as well as social management and legal challenges present themselves in the transformation to this vision the book presents a non technical review of research and initiatives and a discussion of such opportunities and challenges
