master s thesis from the year 2017 in the subject mathematics stochastics grade 1 3 technical university of darmstadt language english
abstract this thesis deals with the development of an alpha quantile estimate based on a surrogate model with the use of artificial neural
networks using artificial neural networks as an estimate is considered a nonparametric approach the estimation of a specific quantile of
a data population is a widely used statistical task and a comprehensive way to discover the true relationship among variables it can be
classified as nonparametric regression where it is one of the standard tasks the most common selected levels for estimation are the first
second and third quartile 25 50 and 75 percent the quantile level is given by alpha a 25 percent quantile for example has 25 percent of

the data distribution below the named quantile and 75 percent of the data distribution above it sometimes the tail regions of a population characteristic are of interest rather than the core of the distribution quantile estimation is applied in many different contexts financial economics survival analysis and environmental modelling are only a few of them

this encyclopedia is composed of an eight volume set that provides an overview of the field of environmental analysis the contents are divided into major content areas including air pollution control environmental law and environmental sampling the volumes are organized alphabetically with each article signed by the author s the individual articles begin with a summary of the topic heading and then divide the text into subtopics indicated by boldface headings the articles are written clearly however the authors assume a basic knowledge of chemistry and math on the part of the reader for example the acid mine drainage article refers to the arrhenius equation but does not clarify this statement in the text each article contains graphs as well as pictures to illustrate points made in the text the articles are long and provide a detailed explanation of each topic the authors also provide a bibliography at the end of each article special features of the encyclopedia include a list of contributors a table of conversion factors and a list of abbreviations and acronyms the preface outlines the general contents of the encyclopedia the preface also includes sections that suggest the target audience and recommended usages for the set the final volume of the set contains an alphabetic index to the topics contained in the volumes

since through trips can be a significant portion of travel in a study area estimating them is an important part of travel demand modeling in the past through trips have been estimated using external surveys recently external surveys were suspended in texas so texas transportation planners need a way to estimate through trips without using external surveys other research in the area has focused on study areas with a population of less than 200 000 but many texas study areas have a population of more than 200 000 this research developed a set of two logit models to estimate through trips for a wide range of study area sizes including larger study areas the first model estimates the portion of all trips at an external station that are through trips the second model distributes those through trips at

one external station to the other external stations the models produce separate results for commercial and noncommercial vehicles and these results can be used to develop through trip tables for predictor variables the models use results from a very simple gravity model the average daily traffic adt at each external station as a proportion of the total adt at all available external stations the number of turns on the routes between external station pairs and whether the route is valid where a valid route is one that passes through the study area and does not pass through any other external stations evaluations of the performance of the models showed that the predictions fit the observations reasonably well at least 68 percent of the absolute prediction errors for each model and for the models combined were less than 10 percent these results indicate that the models can be useful for practical applications

this book presents a new approach to incorporating regional details on production in a disequilibrium macroeconometric model the early studies on disequilibrium dealt with either partial adjustment models or models involving excess demand or supplies in markets this study delves further by considering a different type of disequilibrium model one in which econometric analysis makes use of the varying coefficients stochastic production frontier approach which permits estimation and analysis of production efficiencies of individual producers the diverse regional agricultural production conditions in india provide an appropriate basis for application of the methodology developed in this study by providing a perspective on regional implications of selected policy measures impacting on agriculture either directly or indirectly
