the problem of solving complex engineering problems has always been a major topic in all industrial fields such as aerospace civil and mechanical engineering the use of numerical methods has increased exponentially in the last few years due to modern computers in the field of structural mechanics moreover a wide range of numerical methods have been presented in the literature for solving such problems structural mechanics problems are dealt with using partial differential systems

of equations that might be solved by following the two main classes of methods domain decomposition methods or the so called finite element methods and mesh free methods where no decomposition is carried out both methodologies discretize a partial differential system into a set of algebraic equations that can be easily solved by computer implementation the aim of the present special issue is to present a collection of recent works on these themes and a comparison of the novel advancements of both worlds in structural mechanics applications

this second volume of a two volume work discussessystematically the complete theory of space beam columns it presents principles and methods of analysis for beam columns in space which should be the basis for structuraldesign and shows how these theories are applied for thesolution of practical design problems an unabridged j ross

handbook of approximation algorithms and metaheuristics second edition reflects the tremendous growth in the field over the past two decades through contributions from leading experts this handbook provides a comprehensive introduction to the underlying theory and methodologies as well as the various applications of approximation algorithms and metaheuristics volume 1 of this two volume set deals primarily with methodologies and traditional applications it includes restriction relaxation local ratio approximation schemes randomization tabu search evolutionary computation local search neural networks and other metaheuristics it also explores multi objective optimization reoptimization sensitivity analysis and stability traditional applications covered include bin packing multi dimensional packing steiner trees traveling salesperson scheduling and related problems volume 2 focuses on the contemporary and emerging applications of methodologies to problems in combinatorial optimization computational geometry and graphs problems as well as in large scale and emerging application areas it includes approximation algorithms and heuristics for clustering networks sensor and wireless communication bioinformatics search streams virtual communities and more about the editor teofilo f gonzalez is a professor emeritus of computer science at the university of california santa barbara he completed his ph d in 1975 from the university of minnesota he taught at the university of oklahoma the pennsylvania state university and the university of texas at dallas before joining the ucsb computer science faculty in 1984 he spent sabbatical leaves at the monterrey institute of technology and higher education and utrecht university he is known

for his highly cited pioneering research in the hardness of approximation for his sublinear and best possible approximation algorithm for  $k$  tmm clustering for introducing the open shop scheduling problem as well as algorithms for its solution that have found applications in numerous research areas as well as for his research on problems in the areas of job scheduling graph algorithms computational geometry message communication wire routing etc

the book comprises select proceedings of the 2016 annual conference of the indian geotechnical society igc 2016 with technical papers on the theme ground improvement and geosynthetics the papers cover a wide range of topics including chemical modification using admixtures microbial induced carbonate precipitation geopolymers fly ash and other industrial wastes modification using geosynthetic materials such as natural and synthetic fibers expanded polystyrene eps geofoam prefabricated vertical drains geosynthetic encased granular columns and mechanical densification through sand columns this book is a valuable reference for researchers and practicing engineers alike

with global populations expected to exceed 9.2 billion by 2050 and available land and water resources devoted to crop production dwindling we face significant challenges to secure global food security only 12 plant species feed 80% of the world's population with just three crop species wheat rice and maize accounting for food consumed by 50% of the global population annual losses to crop pests and pathogens are significant thought to be equivalent to that required to feed a billion people at a time when crop productivity has plateaued with pesticide applications becoming increasingly unfeasible on cost efficacy and environmental grounds there is growing interest in exploiting plant resistance and tolerance traits for crop protection indeed mankind has been selectively breeding plants for desirable traits for thousands of years however resistance and tolerance traits have not always been those most desired and in many cases have been inadvertently lost during the domestication process crops have been effectively disarmed by domestication moreover mechanistic understanding of how resistance and tolerance traits operate is often incomplete which makes identifying the right combination for crop protection difficult we aimed to address this research topic by inviting authors to contribute their knowledge of appropriate resistance and tolerance traits explore what is known about durability and breakdown of defensive traits and finally asking what are the prospects for exploiting these traits for crop protection the research topic summarised in this book addresses some of the most important issues in the future sustainability of global crop production

this bibliography had its inception in 1967 when the compilers first attempted a comprehensive coverage of the finite element literature using both manual and computer based retrieval initially the data base was stored on a card index but this was subsequently transferred to punched cards and magnetic tape computer processing was adopted at an early stage to derive the three index formats from the data base over the subsequent years several versions of the bibliography were produced with two of these being made available in a report form to other researchers from the widespread interest in these documents it became evident that there was a need for a commercially available comprehensive bibliography in this area a major effort was undertaken to revise update and extend the data base resulting in this present volume the bibliography covers the period 1956-1975 primarily although some earlier publications of historical interest are included the

citations are not restricted to the english language and documents are listed in many languages and from diverse places of origin all publication formats were accepted so that references will be found to books monographs journal papers and articles theses dissertations reports surveys and the like

during the past two decades owing to the advent of digital computers numerical methods of analysis have become very popular for the solution of complex problems in physical and management sciences and in engineering as the price of hardware keeps decreasing rapidly experts predict that in the near future one may have to pay only for software this underscores the importance of numerical computation to the scientist and engineers and today most undergraduates and postgraduates are being given training in the use of computers and access to the computers for the solution of problems
