the articles in this book review hybrid experimental computational methods applied to soft tissues which have been developed by worldwide specialists in the field people developing computational models of soft tissues and organs will find solutions for calibrating the material parameters of their models people performing tests on soft tissues will learn what to extract from the data and how to use these data for their models and people worried about the complexity of the biomechanical behavior of soft tissues will find relevant approaches to address this complexity

animal groups often display striking collective organization which relies on social interactions these interactions require neural substrates supporting the exchange of information among individuals and the processing of this information the social brain hypothesis suggested from neuroanatomical findings in primates posits that increasing levels of sociality involve a higher investment in neural tissue to cope with social information however distributed cognition and swarm intelligence might alleviate the cognitive load on the individuals and potentially reduce their neural requirements research on social insects which are an exemplar of collective action has so far produced mixed results individual cognition and collective action have received a lot of attention and much progress has been done in each of those fields however much less is understood about how the two interact our goal is to aggregate theoretical and experimental research

exploring the links between the complexity of individual and collective behaviors experimental research testing the social brain hypothesis showed little support for a general explanation across the animal kingdom the relationship between the cognitive abilities of animals and their social interactions are much more complex than previously thought and tackling this problem requires a better knowledge of the fundamental mechanisms underpinning socio cognitive tasks what is the information used by the animals during social interactions how much information is necessary how many neurons and which neural circuits are required for processing this information what neural connections are important do these social interactions involve memory formation how do the cognitive requirements and neural circuits vary between group members answering these questions will bring considerable insights into the cognitive complexity involved for social and collective behaviors it will also advance our understanding of inter individual cognitive variability and division of labor in most socially advanced species this research topic will be a unique forum for researchers from different fields neurogenetics neuro ethology evolutionary ecology cognitive ecology collective animal behavior computational modeling working on different species to present up to date advances on the physiological correlates of social behavior and delineate future directions for the field of social neuroethology we welcome contributions on any aspect of the cognitive requirements of social and collective behaviors from molecular cellular and circuit level approaches to how individuals contribute to group action at the behavioral level specific areas of interest include but are not limited to studies on the neural underpinnings of division of labor neuromodulation or neurogenetics of social behaviors the neural circuits and neuroanatomical basis of group action and how social signals affect learning and behavior we encourage submissions that present original research and review evidence or compare data from multiple species we hope to include work from different disciplines and on a wide range of species including model non model and wild animals with the aim of gaining insight into the patterns of neural investment in individual cognition

this book provides a unique and timely multidisciplinary synthesis of our current knowledge of the anatomy pharmacology physiology and pathology of the substantia nigra pars compacta snc dopaminergic neurons the single chapters written by top scientists in their fields explore the life cycle of dopaminergic neurons from their birth to death the cause of parkinson s disease the second most common and disabling condition in the elderly population nevertheless the intracellular cascade of events leading to dopamine cell death is still unknown and consequently treatment is symptomatic rather than preventive the mechanisms by which alterations cause neuronal death new therapeutic approaches and the latest evidence of a possible de novo neurogenesis in the snc are reviewed and singled out in different chapters this book bridges basic science and clinical practice and will prepare the reader for the next few years which will surely be eventful in terms of the progress of dopamine research
