the design and development of electrical devices involves choosing from many possible variants that which is the best or optimum according to one or several criteria these optimization criteria are usually already clear to the designer at the statement of the design problem the methods of optimization considered in this book allow us to sort out variants of the realization of a design on the basis of these criteria and to create the best device in the sense of the set criteria optimization of devices is one of the major problems in electrical engineering that is related to an extensive class of inverse problems including synthesis diagnostics fault detection identification and some others with common mathematical properties when designing a device the engineer actually solves inverse problems by defining the device structure and its parameters and then proceeds to deal with the technical specifications followed by the incorporation of his own notions of the best device frequently the solutions obtained are based on intuition and previous experience new methods and approaches discussed in this book will add mathematical rigor to these intuitive notions by virtue of their urgency inverse problems have been investigated for more than a century however general methods for their solution have been developed only recently an analysis of the scientific literature indicates a steadily growing interest among scientists and engineers in these problems
