mercury is widespread in our environment methylmercury an organic form of mercury can accumulate in the aquatic food chain and lead to high concentrations in predatory fish when consumed by humans contaminated fish represent a public health risk toxic effects of mercury intends to facilitate among its readers the understanding of the importance of mercury pollution in the environment and the health consequences associated with exposure to this metal the knowledge on methylmercury mehg toxicity collected over the years is undoubtedly robust creating an impression all that is to be learnt about this metal has already been accomplished however in large measure past knowledge has merely laid the ground for interesting questions that have yet to be fully addressed and concepts have yet to be deciphered one of my major goals was to make a valiant attempt to include state of the art information on the mechanisms of mercury toxicity describing its effects on cultured cellular systems as well as in whole living organisms starting from the lessons learned from the tragic events in minamata bay japan a special focus of the book is on the neurotoxic effects of mehg an understanding at the cellular level is necessary to gather information on the structural and functional alterations induced by mehg and how they possibly become unmasked and evident at the behavioral level 32 chapters of the book have been organised having these considerations in mind this book will provide state of the art information to the graduate students training in toxicology risk assessors researchers

and medical providers at large it is aimed to bring the readers updated information on contemporary issues associated with exposure to methylmercury from its effects on stem cells and neurons to population studies it is a valuable resource for individuals interested in the public health effects and regulation of mercury the report provides an excellent example of the implications of decisions in the risk assessment process for a larger audience and is written with the hope that the information will provide better understanding of the mercury problems which confront us

abstract measurements in southern fennoscandia show a weak declining trend in mercury deposition which can be attributed to reduction controls in eu countries deposition of mercury in arctic areas is likely to be governed by the amount of mercury in background air and therefore largely dependent on mercury emissions from mercury sources in the entire northern hemisphere hence further reduction in anthropogenic emissions of mercury will require control measures in the entire northern hemisphere the so called atmospheric mercury depletion events amdes are occurring during polar spring how much of the deposited mercury that remains contra is re emitted to the atmosphere is however crucial for assessing the importance of amde in the arctic environment forest soils are an important sink for mercury deposited from the atmosphere however this sink can be affected by perturbations in conjunction to common forestry practices and lead to mobilization of the stored mercury and enhanced methyl mercury formation similar effects can be expected in areas where climate change results in large increases in precipitation amounts the processes governing these changes in mercury mobilization are to some extent unknown and general predictions of the magnitude of the changes are thus associated with a large degree of uncertainty

mercury pollution and contamination are widespread well documented and continue to pose a public health concern in both developed and developing countries in response to a growing need for understanding the cycling of this ubiquitous pollutant the science of mercury has grown rapidly to include the fields of biogeochemistry economics sociology public health decision sciences physics global change and mathematics only recently have scientists begun to establish a holistic approach to studying mercury pollution that integrates chemistry biology and human health sciences mercury in the environment follows the process of mercury cycling through the atmosphere through terrestrial and aquatic food webs and through human populations to develop a comprehensive perspective on this important environmental problem this timely reference also provides recommendations on mercury remediation risk communication education and monitoring

great salt lake is an enormous terminal lake in the western united states it is a highly productive ecosystem which has global significance for millions of migrating birds who rely on this critical feeding station on their journey through the american west for the human population in the adjacent metropolitan area this body of water provides a significant economic resource as industries such as brine shrimp harvesting and mineral extraction generate jobs and income for the state of utah in addition the lake provides the local population with ecosystem services especially the creation of mountain snowpack that generates water supply and the prevention of dust that may impair air quality as a result of

climate change and water diversions for consumptive uses terminal lakes are shrinking worldwide and this edited volume is written in this urgent context this is the first book ever centered on great salt lake biology current and novel data presented here paint a comprehensive picture building on our past understanding and adding complexity together the authors explore this saline lake from the microbial diversity to the invertebrates and the birds who eat them along a dynamic salinity gradient with unique geochemistry some unusual perspectives are included including the impact of tar seeps on the lake biology and why great salt lake may help us search for life on mars also we consider the role of human perceptions and our effect on the biology of the lake the editors made an effort to involve a diversity of experts on the great salt lake system but also to include unheard voices such as scientists at state agencies or non profit advocacy organizations this book is a timely discussion of a terminal lake that is significant unique and threatened

health care is constantly undergoing change and refinement resulting from the adoption of new practices and technologies the changing nature of societies and populations and also shifts in the very places from which care is delivered primary health care people practice place draws together significant contributions from established experts across a variety of disciplines to focus on such changes in primary health care not only because it is the most basic and integral form of health service delivery but also because it is an area to which geographers have made significant contributions and to which other scholars have engaged in thinking geographically about its core concepts and issues including perspectives from both consumers and producers it moves beyond geographical accounts of the context of health service provision through its explicit focus on the practice of primary health care with arguments well supported by empirical research this book will appeal not only to scholars across a range of social and health sciences but also to professionals involved in health services

the problems related to the process of industrialisation such as biodiversity depletion climate change and a worsening of health and living conditions especially but not only in developing countries intensify therefore there is an increasing need to search for integrated solutions to make development more sustainable the united nations has acknowledged the

problem and approved the 2030 agenda for sustainable development on 1st January 2016 the 17 sustainable development goals (SDGs) of the agenda officially came into force. These goals cover the three dimensions of sustainable development: economic growth, social inclusion, and environmental protection. The encyclopedia of the UN Sustainable Development Goals comprehensively addresses the SDGs in an integrated way. It encompasses 17 volumes, each devoted to one of the 17 SDGs. This volume is dedicated to SDG 6: Ensure availability and sustainable management of water and sanitation for all. Water and sanitation are fundamental to human well-being. Integrated water resources management is essential to ensure availability and sustainable management of water and sanitation for all and to the realization of sustainable development. Concretely, the defined targets are: achieve universal and equitable access to safe and affordable drinking water for all; achieve access to adequate and equitable sanitation and hygiene for all and end open defecation, paying special attention to the needs of women and girls and those in vulnerable situations; improve water quality by reducing pollution, eliminating dumping and minimizing release of hazardous chemicals and materials, halving the proportion of untreated wastewater and substantially increasing recycling and safe reuse globally; substantially increase water use efficiency across all sectors and ensure sustainable withdrawals and supply of freshwater to address water scarcity and substantially reduce the number of people suffering from water scarcity; implement integrated water resources management at all levels, including through transboundary cooperation as appropriate; protect and restore water-related ecosystems, including mountains, forests, wetlands, rivers, aquifers, and lakes; expand international cooperation and capacity-building support to developing countries in water and sanitation-related activities and programmes, including water harvesting, desalination, water efficiency, wastewater treatment, recycling, and reuse technologies; support and strengthen the participation of local communities in improving water and sanitation management.

Examining tissue residues of contaminants in biota reveals the movement of contaminants within organisms and through food chains, as well as the context for understanding and quantifying injuries to organisms and their communities. Yet tissue concentrations of some contaminants are especially challenging to interpret, and the ability of today's analytical chemists to provide reliable analytical data of most important environmental contaminants often surpasses the ability of ecotoxicologists to interpret those data, offering guidance on the ecotoxicologically meaningful interpretation of tissue concentrations. Environmental contaminants in biota: interpreting tissue concentrations, second edition, is updated with current data and new ways of analyzing those data, as well as additional contaminants not previously considered. Beginning with a history of wildlife toxicology and data interpretation, chapters cover a wide range of contaminants and their hazardous and lethal concentrations in various animals, including DDT, dioxins, PCBs, and PBDEs in aquatic organisms; methylmercury, selenium, and trace metals in fishes and aquatic invertebrates; and pharmaceuticals and organic contaminants in marine mammals. The book considers the impact of polychlorinated biphenyls, dibenzo-p-dioxins, and dibenzofurans, and polybrominated diphenyl ethers, cyclodiene, and other organochlorine pesticides in birds and mammals. Later chapters examine the effects and analysis of lead, cadmium, and radionuclides in biota. With thousands of published research papers reporting tissue concentrations each year, environmental contaminants in biota: interpreting tissue concentrations, second edition, gives ecotoxicologists the ability to draw actionable value regarding the toxicological consequences of those concentrations and relate tissue concentrations quantitatively to injury. The core of ecotoxicology.

This book provides the fundamentals, recent developments, and future research needs for

critical mercury transformation and transport processes as well as the experimental methods that have been employed in recent studies the coverage discusses the environmental behavior and toxicological effects of mercury on organisms including humans and provides case studies at the end of each chapter bringing together information normally spread across several books this text is unique in covering the entire mercury cycle and providing a baseline for what is known and what uncertainties remain in respect to mercury cycling

the instrument and automation engineers handbook iaeh is the number 1 process automation handbook in the world the two volumes in this greatly expanded fifth edition deal with measurement devices and analyzers volume one measurement and safety covers safety sensors and the detectors of physical properties while volume two analysis and analysis describes the measurement of such analytical properties as composition complete with 245 alphabetized chapters and a thorough index for quick access to specific information the iaeh fifth edition is a must have reference for instrument and automation engineers working in the chemical oil gas pharmaceutical pollution energy plastics paper wastewater food etc industries
