our understanding of the fundamental processes of the natural world is based to a large extent on partial differential equations pdes the second edition of partial differential equations provides an introduction to the basic properties of pdes and the ideas and techniques that have proven useful in analyzing them it provides the student a broad perspective on the subject illustrates the incredibly rich variety of phenomena encompassed by it and imparts a working knowledge of the most important techniques of analysis of the solutions of the equations in this book mathematical jargon is minimized our focus is on the three most classical pdes the wave heat and laplace equations advanced concepts are introduced frequently but with the least possible technicalities the book is flexibly designed for juniors seniors or beginning graduate students in science engineering or mathematics

this volume contains the proceedings of the 1999 international conference on differential equations and mathematical physics the contributions selected for this volume represent some of the most important presentations by scholars from around the world on developments in this area of research the papers cover topics in the general area of linear and nonlinear differential equations and their relation to mathematical physics such as multiparticle schrödinger operators stability of matter relativity theory fluid dynamics spectral and scattering theory including inverse problems titles in this series are co published with international press cambridge ma

contemporary developments in continuum mechanics and partial differential equations

on march 17 19 and may 19 21 1995 analysis seminars were organized jointly at the universities of copenhagen and lund under the heading danish swedish analysis seminar the main topic was partial differential equations and related problems of mathematical physics the lectures given are presented in this volume some as short abstracts and some as quite complete expositions or survey papers they span over a large variety of topics the most frequently occurring theme is the use of microlocal analysis which is now important also in the study of non linear differential equations although it originated entirely within the linear theory perhaps it is less surprising that microlocal analysis has proved to be useful in the study of mathematical problems of classical quantum mechanics for it received a substantial input of ideas from that field the scientific committee for the invitation of speakers consisted of gerd grubb in copenhagen lars hormander and anders mehn in lund and jo hannes sjostrand in paris lars hormander and anders melin have edited the proceedings they were hosts of the seminar days in lund while gerd grubb was the host in copenhagen financial support was obtained from the mathematics departments in copenhagen and lund cnrs in france the danish and swedish national research councils gustaf sigurd magnuson s foundation at the royal swedish academy of sciences and the wenner gren foundation in stockholm we want to thank all these organisations for their

support

mark vishik was one of the prominent figures in the theory of partial differential equations his ground breaking contributions were instrumental in integrating the methods of functional analysis into this theory the book is based on the memoirs of his friends and students as well as on the recollections of mark vishik himself and contains a detailed description of his biography childhood in lwów his connections with the famous lwów school of stefan banach a difficult several year long journey from lwów to tbilisi after the nazi assault in june 1941 going to moscow and forming his own school of differential equations whose central role was played by the famous vishik seminar at the department of mechanics and mathematics at moscow state university the reader is introduced to a number of remarkable scientists whose lives intersected with vishik s including s banach j schauder i n vekua n i muskhelishvili l a lyusternik i g petrovskii s l sobolev i m gelfand m g krein a n kolmogorov n i akhiezer j leray j l lions l schwartz l nirenberg and many others the book also provides a detailed description of the main research directions of mark vishik written by his students and colleagues as well as several reviews of the recent development in these directions

this book provides an overview of different topics related to the theory of partial differential equations selected exercises are included at the end of each chapter to prepare readers for the research project for beginners proposed at the end of the book it is a valuable resource for advanced graduates and undergraduate students who are interested in specializing in this area the book is organized in five parts in part 1 the authors review the basics and the mathematical prerequisites presenting two of the most fundamental results in the theory of partial differential equations the cauchy kovalevskaja theorem and holmgren s uniqueness theorem in its classical and abstract form it also introduces the method of characteristics in detail and applies this method to the study of burger s equation part 2 focuses on qualitative properties of solutions to basic partial differential equations explaining the usual properties of solutions to elliptic parabolic and hyperbolic equations for the archetypes laplace equation heat equation and wave equation as well as the different features of each theory it also discusses the notion of energy of solutions a highly effective tool for the treatment of non stationary or evolution models and shows how to define energies for different models part 3 demonstrates how phase space analysis and interpolation techniques are used to prove decay estimates for solutions on and away from the conjugate line it also examines how terms of lower order mass or dissipation or additional regularity of the data may influence expected results part 4 addresses semilinear models with power type non linearity of source and absorbing type in order to determine critical exponents two well known critical exponents the fujita exponent and the strauss exponent come into play depending on concrete models these critical exponents divide the range of admissible powers in classes which make it possible to prove quite different qualitative properties of solutions for
