the subject of partial differential equations holds an exciting and special position in mathematics partial differential equations were not consciously created as a subject but emerged in the 18th century as ordinary differential equations failed to describe the physical principles being studied the subject was originally developed by the major names of mathematics in particular leonard euler and joseph louis lagrange who studied waves

on strings daniel bernoulli and euler who considered potential theory with later developments by adrien marie legendre and pierre simon laplace and joseph fourier s famous work on series expansions for the heat equation many of the greatest advances in modern science have been based on discovering the underlying partial differential equation for the process in question james clerk maxwell for example put electricity and magnetism into a unified theory by establishing maxwell s equations for electromagnetic theory which gave solutions for prob lems in radio wave propagation the diffraction of light and x ray developments schrodinger s equation for quantum mechanical processes at the atomic level leads to experimentally verifiable results which have changed the face of atomic physics and chemistry in the 20th century in fluid mechanics the navier stokes equations form a basis for huge number crunching activities associated with such widely disparate topics as weather forecasting and the design of supersonic aircraft inevitably the study of partial differential equations is a large undertaking and falls into several areas of mathematics

this volume contains a complete and self contained treatment of hamilton jacobi equations the author gives a new presentation of classical methods and of the relations between hamilton jacobi equations and other fields this complete treatment of both classical and recent aspects of the subject is presented in such a way that it requires only elementary notions of analysis and partial differential equations

contains research articles on the mathematics and applications of control theory and on those parts of optimization theory concerned with the dynamics of deterministic or stochastic systems in continuous or discrete time or otherwise dealing with differential equations dynamics infinite dimensional spaces or fundamental issues in variational analysis and geometry
