density is an important component of hot mix asphalt hma pavement quality and long term performance insufficient density of an in place hma pavement is the most frequently cited construction related performance problem this study evaluated the use of electromagnetic gauges to nondestructively determine densities field and laboratory measurements were taken with two electromagnetic gauges a pavetracker and a pavement quality indicator pqi test data were collected in the field during and after paving operations and also in laboratory on field mixes compacted in the lab this study revealed that several mix and project specific factors affect electromagnetic gauge readings consequently the implementation of these gauges will likely need to be done utilizing a test strip on a project and mix specific basis to appropriately identify an adjustment factor for the specific electromagnetic gauge being used for quality control and quality assurance qc qa testing the substantial reduction in testing time that results from employing electromagnetic gauges rather than coring makes it possible for more readings to be used in the qc qa process with real time information without increasing the testing costs

thus epidemiological studies suggest that children living near electric power lines have an increased risk of leukemia and clinical studies show that low energy pulsed emfs accelerate healing of bone fractures the mechanisms underlying these effects are not yet understood but in vitro studies show that low energy emfs induce changes in protein syntheses that are similar to the stress response found normally in all cells this 26 chapter book provides a comprehensive survey of the multifaceted issues raised by environmental emfs by looking at physical and biological fundamentals of emfs health risks and benefits of exposure and biophysical and biochemical mechanisms of interaction
