abstract scientific computation has always been one of the driving forces behind the design of computer systems as a result many advances in cpu architecture were first developed for high speed supercomputer systems keeping them among the fastest computers in the world however little research has been done in storing the vast quantities of data that scientists manipulate on these powerful computers this thesis first characterizes scientists usage of a multi terabyte tertiary storage system attached to a high speed computer the analysis finds that the number of files and average file size have both increased by several orders of magnitude since 1980 the study also finds that integration of tertiary storage with secondary storage is critical many of the accesses to files stored on tape could have easily been avoided had scientists seen a unified view of the mass storage hierarchy instead of the two separate views of the system studied this finding was a major motivation of the design of the rama file system the remainder of the thesis describes the design and simulation of a massively parallel processor mpp file system that is simple easy to use and integrates well with tertiary storage mpps are increasingly commonly used for scientific computation yet their file systems require great attention to detail to get acceptable performance worse a program that performs well on one machine may perform poorly on a similar machine with a slightly different file system rama solves this problem by pseudo randomly distributing data to a disk attached to each processor making performance independent of program usage patterns it does this without sacrificing the high performance that scientific users demand as shown by simulations comparing the performance of rama and a striped file system on both real and synthetic benchmarks additionally rama can be easily integrated with tertiary storage systems providing a unified view of the file system spanning both disk and tape systems rama s ease of use and simplicity of design make it an ideal choice for the massively parallel computers used by the scientific community
