ferromagnetism is a form of magnetism that can be acquired in an external magnetic field and usually retained in its absence so that ferromagnetic materials are used to make permanent magnets a ferromagnetic material may therefore be said to have a high magnetic permeability and susceptibility which depends upon temperature examples are iron cobalt nickel and their alloys ultimately ferromagnetism is caused by spinning electrons in the atoms of the material which act as tiny weak magnets they align parallel to each other within small regions of the material to form domains or areas of stronger magnetism in an unmagnetised material the domains are aligned at random so there is no overall magnetic effect if a magnetic field is applied to that material the domains align to point in the same direction producing a strong overall magnetic effect permanent magnetism arises if the domains remain aligned after the external field is removed ferromagnetic materials exhibit hysteresis in 2004 it was discovered that a certain allotrope of carbon nanofoam exhibited ferromagnetism the effect dissipates after a few hours at room temperature but lasts longer at cold temperatures the material is also a semiconductor it is thought that other similarly formed materials of boron and nitrogen may also be ferromagnetic this new book rings together leading research from throughout the world

the historical interface between science and religion was depicted as an unbridgeable conflict in the last quarter of the nineteenth century starting in the 1970s such a conception was too simplistic and not at all accurate when considering the totality of that relationship this volume evaluates the utility of the complexity principle in past present and future scholarship first put forward by historian john brooke over twenty five years ago the complexity principle rejects the idea of a single thesis of conflict or harmony or integration or separation between science and religion rethinking history science and religion brings together an interdisciplinary group of scholars at the forefront of their fields to consider whether new approaches to the study of science and culture such as recent developments in research on science and the history of publishing the global history of science the geographical examination of space and place and science and media have cast doubt on the complexity thesis or if it remains a serviceable historiographical model
