mark l latash approaches motor control as a biological discipline that requires the language of laws of nature sets of adequate concepts specific for biological movement and exploration using the scientific method developed in natural science seminars in motor control introduces and develops the theory of the parametric control of movement with spatial referent coordinates a generalization of the equilibrium point hypothesis which is naturally compatible with the principle of abundance and the uncontrolled manifold hypothesis the chapters discuss potential neurophysiological mechanisms involved in ensuring stability of functional movements and the relations among movement stability agility and optimality the author addresses issues such as posture movement paradox equifinality and its violations motor equivalence muscle coactivation multi muscle and intra muscle synergies unintentional drifts in performance kinesthetic perception changes in movements with fatigue aging motor learning neurological disorders and rehabilitation consisting of five parts seminars in motor control examines current research in a clear and accessible style ideal for graduate students postdoctoral fellows and faculty in such

energetic kinesiology is an emerging field internationally in the complementary health sciences gaining more and more scientific support and recognition this fully referenced textbook describes the field and explains the techniques upon which it is built it covers the underlying principles the methods and scientific support for the efficacy of energetic kinesiology it also offers a unique history of energetic kinesiology based on the first hand experience of charles krebs who knew most of the originators of energetic kinesiology techniques personally the book is a unique well illustrated single source of a vast array of information research and clinical knowledge in a format that is both accessible and practical to clinicians and students

synergy discusses a general problem in biology the lack of an adequate language for formulating biologically specific problems written for an inquisitive reader who is not necessarily a professional in the area of movement studies this book describes the recent progress in the control and coordination of human movement the book begins with a brief history of movement studies and reviews the current central controversies in the area of control of movements with an emphasis on the equilibrium point hypothesis an operational definition of synergy is introduced and a method of analysis of synergies is described based on the uncontrolled manifold hypothesis further this method is used to characterize synergies in a variety of tasks including such common motor tasks as standing pointing reaching standing up and manipulation of hand held objects applications of this method to movements by persons with neurological disorders persons with atypical development and healthy elderly persons are illustrated as well as changes in motor synergies with practice possible neurophysiological mechanisms of synergies are also discussed with the focus on such conspicuous structures as the spinal cord the cerebellum the basal ganglia and the cortex of the large hemispheres a variety of models are discussed based on different computational and neurophysiological principles possible applications of the introduced definition of synergies to other areas such as perception and language are discussed
