the aim of this volume is to collect original contributions by the best specialists from the area of proof theory constructivity and computation and discuss recent trends and results in these areas some emphasis will be put on ordinal analysis reductive proof theory explicit mathematics and type theoretic formalisms and abstract computations the volume is dedicated to the 60th birthday of professor gerhard jäger who has been instrumental in shaping and promoting logic in switzerland for the last 25 years it comprises contributions from the symposium advances in proof theory which was held in bern in december 2013 proof theory came into being in the twenties of the last century when it was inaugurated by david hilbert in order to secure the foundations of mathematics it was substantially influenced by gödel s famous incompleteness theorems of 1930 and gentzen s new consistency proof for the axiom system of first order number theory in 1936 today proof theory is a well established branch of mathematical and philosophical logic and one of the pillars of the foundations of mathematics proof theory explores constructive and computational aspects of

mathematical reasoning it is particularly suitable for dealing with various questions in computer science

optical coatings i e multilayer stacks composed from a certain number of thin individual layers are an essential part of any optical system necessary to tailor the properties of the optical surfaces hereby the performance of any optical coating is defined by a well balanced interplay between the properties of the individual coating materials and the geometrical parameters such as film thickness which define their arrangement in all scientific books dealing with the performance of optical coatings the main focus is on optimizing the geometrical coating parameters particularly the number of individual layers and their thickness at the same time much less attention is paid to another degree of freedom in coating design namely the possibility to tailor optical material properties to an optimum relevant for the required specification this book on the contrary concentrates on the material aside of the problem after a comprehensive review of the basics of thin film theory traditional optical coating material properties and their relation to the efficiency of coating design methods emphasis is placed on novel results concerning the application of material mixtures and nanostructured coatings in optical coating theory and practice including porous layers dielectric mixtures as well as metal island films for different applications

ricci solitons in dimensions 4 and higher offers a detailed account of recent developments of ricci solitons self similar solutions to the ricci flow equation which play a central role in modeling the formation of singularities of the flow building on the foundational work of hamilton and perelman and the recent advances of bamler brendle and others this book focuses on the rich and technically demanding theory of these solutions with special attention to dimension 4 where potential applications to the topology of smooth 4 manifolds are most promising the authors present key results open problems and new perspectives on the structure and asymptotic behavior of complete noncompact solitons the case of greatest significance to singularity analysis the volume offers a systematic and research oriented reference for ongoing work in geometric analysis covering both foundational material and specialized topics areas of focus include curvature growth and decay

bounds on the number of topological ends asymptotically conical and asymptotically cylindrical solitons volume growth and applications of hamilton's theory written for graduate students and researchers in differential geometry geometric analysis and mathematical physics the book is accessible to readers with a solid background in riemannian geometry and partial differential equations while self contained in its core exposition it serves as both a technical resource and an invitation to contribute to the study of ricci flow in dimensions 4 and higher

the publication of this book in 1970 marked the culmination of a particularly exciting period in the history of the topology of manifolds the world of high dimensional manifolds had been opened up to the classification methods of algebraic topology by thom's work in 1952 on transversality and cobordism the signature theorem of hirzebruch in 1954 and by the discovery of exotic spheres by milnor in 1956 in the 1960s there had been an explosive growth of interest in the surgery method of understanding the homotopy types of manifolds initially in the differentiable category including results such as the h cobordism theory of smale 1960 the classification of exotic spheres by kervaire and milnor 1962 browder's converse to the hirzebruch signature theorem for the existence of a manifold in a simply connected homotopy type 1962 the s cobordism theorem of barden mazur and stallings 1964 novikov's proof of the topological invariance of the rational pontrjagin classes of differentiable manifolds 1965 the fibering theorems of browder and levine 1966 and farrell 1967 sullivan's exact sequence for the set of manifold structures within a simply connected homotopy type 1966 casson and sullivan's disproof of the hauptvermutung for piecewise linear manifolds 1967 wall's classification of homotopy tori 1969 and kirby and siebenmann's classification theory of topological manifolds 1970 the original edition of the book fulfilled five purposes by providing a coherent framework for relating the homotopy theory of manifolds to the algebraic theory of quadratic forms unifying many of the previous results a surgery obstruction theory for manifolds with arbitrary fundamental group including the exact sequence for the set of manifold structures within a homotopy type and many computations the extension of surgery theory from the differentiable and piecewise linear categories to the topological category a survey of most of the activity in surgery up to 1970 a setting for the subsequent development and applications of the

surgery classification of manifolds this new edition of this classic book is supplemented by notes on subsequent developments references have been updated and numerous commentaries have been added the volume remains the single most important book on surgery theory
