the purpose of this dissertation is to examine how the method used to a score situational judgment test sjt affects the validity of the sjt both in the presence of other predictors and as a single predictor of task performance to this end i compared the summed score approach of scoring sjts with item response theory and multivariate items response theory using two samples and three sets of analyses i found that the method used to score sjts influences the validity of the test and that irt and mirt show promise for increasing sjt validity however no individual scoring method produced the highest amount of validity across all sets of analyses in line with previous research sjts added incremental validity in the presence of gma and personality and again the method used to score the sjt affected the incremental validity a relative weights analysis was performed for each scoring method across all the sets of analyses showing that depending on the scoring method sjt score may account for more criterion variance than either gma or personality however it is likely that the samples were influenced by range restriction present in the incumbent samples

situational judgment test sjt was developed by hunter 2002 to test pilot judgment sjt is very useful however this test takes too long for participants to complete a mini sjt was developed with shortened questions the purpose of this research was to determine the reliability and validity of mini sjt comprised of 16 of the original 51 questions validity and reliability were the

two key elements in psychometrics face validity was used as a method to measure validity reliability was determined by cronbach s alpha the correlation of split half and even odd and pearson s correlation of test retest participants were general pilots from sun n fun airshow and student pilots from fit four experts from different backgrounds agreed that face validity had been determined results from spss showed that the cronbach s alpha the correlation of split half and even odd tests was in the acceptable range the pearson s correlation was in the moderate level the results showed that the mini sjt could maintain validity and reliability the administration time could reduce mini sjt could be more convenient to use and could be used more widely

situational judgment tests sjts are frequently used by organizations as a face valid selection measure with low adverse impact and a relatively strong relationship with relevant criteria despite their common use there remain several research questions regarding the theoretical foundations and characteristics of sjts additionally developments in sjt scoring provide fertile ground for research to validate new scoring techniques to better predict criteria of interest motowidlo and his colleagues 2006 recently developed a scoring technique for sjts based on the principle of implicit trait policies itps which are implicit beliefs concerning the effectiveness of different behavioral choices that demonstrate varying levels of targeted traits individuals high in these targeted traits will rate item responses that demonstrate high levels of that particular trait as more effective taking into consideration this new method and also considering the multitude of scoring methods already available to test developers it logically follows that these different scoring methods will have different correlations with constructs of interest and that by using this new method it may be possible to achieve a much higher correlation with personality the effects of scoring technique on relationships between sjt scores and constructs of interest such as personality will in turn have effects on the criterion validity of the sjt this research explored how scoring methods affected the relationship sjt scores have with general mental ability personality traits typical performance and maximum performance results indicated significant differential validity as a function of the respondents race for minority participants sjt scores predicted maximum performance ratings in a simulation exercise but not typical performance ratings provided by familiar peers however the reverse was true for caucasian participants the two scoring methods demonstrated differential validity however the nature of these differences varied as a function of the performance dimension in question i e agreeableness extraversion implications for future research will be discussed as well as the practical implications of these findings

a situational judgment test sjt and a big 5 personality test were administered to 203 participants under instructions to respond honestly and to fake good using a within subjects design participants indicated both the best and worst response i e knowledge and the most likely and least likely response i e behavioral tendency to each situation faking effect size for the sjt behavioral tendency response format was d .34 when participants responded first under honest instructions and d .15 when they responded first under faking instructions

those for the big 5 dimensions ranged from $d = .26$ to $d = .10$ for the knowledge response format results were inconsistent honest condition knowledge sjt scores were more highly correlated with cognitive ability $r = .56$ than were behavioral tendency sjt scores $r = .38$ implications for researchers and practitioners are discussed
