written by an internationally recognized teacher and researcher this book provides a thorough modern treatment of the aerodynamic principles of helicopters and other rotating wing vertical lift aircraft such as tilt rotors and autogiros the text begins with a unique technical history of helicopter flight and then covers basic methods of rotor aerodynamic analysis and related issues associated with the performance of the helicopter and its aerodynamic design it goes on to cover more advanced topics in helicopter aerodynamics including airfoil flows unsteady aerodynamics dynamic stall and rotor wakes and rotor airframe aerodynamic interactions with final chapters on autogiros and advanced methods of helicopter aerodynamic analysis extensively illustrated throughout each chapter includes a set of homework problems advanced undergraduate and graduate students practising engineers and researchers will welcome this thoroughly revised and updated text on rotating wing aerodynamics

helicopters are highly capable and useful rotating wing aircraft with roles that encompass a variety of civilian and military applications their usefulness lies in their unique ability to take off and land vertically to hover stationary relative to the ground and to fly forward backward or sideways these unique flying qualities however come at a high cost including complex aerodynamic problems significant vibrations high levels of noise and relatively large power requirements compared to fixed wing aircraft this book written by an internationally recognized expert provides a thorough modern treatment of the aerodynamic principles of helicopters and other rotating wing vertical lift aircraft every chapter is extensively illustrated and concludes with a bibliography and homework problems advanced undergraduate and graduate students practising engineers and researchers will welcome this thorough and up to date text on rotating wing aerodynamics

the last decade has seen a dramatic increase of our abilities to solve numerically the governing equations of fluid mechanics in design aerodynamics the classical potential flow methods have been complemented by higher modelling level methods euler solvers and for special purposes already navier stokes solvers are in use the authors of this book have been working on the solution of the euler equations for quite some time while the first two of us have worked mainly

on algorithmic problems the third has been concerned off and on with modelling and application problems of euler methods when we started to write this book we decided to put our own work at the center of it this was done because we thought and we leave this to the reader to decide that our work has attained over the years enough substance in order to justify a book the problem which we soon faced was that the field still is moving at a fast pace for instance because hyper sonic computation problems became more and more important

the book contains the principles of helicopter flight special characteristics of the main rotor and its function in autorotation axial and oblique flow regimes of vertical and horizontal flight climb and descent takeoff and landing balance stability and control of the helicopter and their acting aerodynamic forces author

abstract this paper presents parallel implementations of two codes used in a combined cfd kirchhoff methodology to predict the aerodynamics and aeroacoustics properties of helicopters the rotorcraft navier stokes code turns computes the aerodynamic flowfield near the helicopter blades and the kirchhoff acoustics code computes the noise in the far field using the turns solution as input the overall parallel strategy adds mpi message passing calls to the existing serial codes to allow for communication between processors as a result the total code modifications required for parallel execution are relatively small the biggest bottleneck in running the turns code in parallel comes from the lu sgs algorithm that solves the implicit system of equations we use a new hybrid domain decomposition implementation of lu sgs to obtain good parallel performance on the sp 2 turns demonstrates excellent parallel speedups for quasi steady and unsteady three dimensional calculations of a helicopter blade in forward flight the execution rate attained by the code on 114 processors is six times faster than the same cases run on one processor of the cray c 90 the parallel kirchhoff code also shows excellent parallel speedups and fast execution rates as a performance demonstration unsteady acoustic pressures are computed at 1886 far field observer locations for a sample acoustics problem the calculation requires over two hundred hours of cpu time on one c 90 processor but takes only a few hours on 80 processors of the sp2 the resultant far field acoustic field is analyzed with state of the art audio and video rendering of the propagating acoustic signals

this lecture series is devoted to major aspects of aerofoil design both for aeronautical and turbomachine application these include 1 optimisation of target pressure and velocity distribution both direct optimisation resulting from an inverse boundary layer calculation and an iterative optimisation of the losses are presented 2 aerofoil design by means of inverse methods this ranges from simple parametric definitions of two dimensional cross sections to a detailed numerical definition of three dimensional shapes blade or airfoil designs are normally made in two steps and the lectures are accordingly grouped into two parts first optimisation of target pressure and velocity distributions are discussed taking into account the required performance and the loss mechanisms in the boundary layer both direct optimisation resulting from an inverse boundary layer calculation and an iterative optimisation by minimisation of the losses are presented it is clear from both procedures that inclusion of off design operation is one of the greatest difficulties involved in blade or airfoil operation the second part gives an overview of the numerous inverse blade design methods that have been developed both for turbomachinery and aeronautical applications this ranges from simple parameter definitions of two dimensional cross sections to the full three dimensional definition of wings and blade channels etc
