this chapter describes the processes involved in the transport of material over hillslopes hillslopes
provide the gradients enabling material to be transported from the slopes themselves towards the
valley bottoms directly by gravity alone or by water flowing down over the surface gravity has the
potential to transfer material downslope if the material resistance to countact it is insufficient
similarly water and wind flowing along the surface exert a drag on soil particles and have the

potential to entrain material after the gradient has fallen below a critical threshold to keep the material in transport deposition occurs conventionally slope processes in which gravity alone is the dominant transporting agent are called mass movements brunsdon 1984 processes in which other agents dominate are called erosion e.g. wind or water erosion flowing water is an important transporting agent on which the emphasis is placed here although mass wasting is a natural process its incidence and impact may be exacerbated by human activities crozier 1986 morgan 2005 a situation may ultimately arise in which human interests become unsafe or unsustainable this impact is not only directly felt in the areas where material is removed or deposited and indirectly mass wasting may have an effect on soil and water quality in areas located further downstream in the following sections a brief overview is given of the mechanisms morphology causes and consequences of mass movements and erosion

sections on important areas such as spread spectrum cellular communications and orthogonal frequency division multiplexing are provided computational examples are included illustrating how to use the computer as a simulation tool thereby allowing waveforms spectra and performance curves to be generated overviews of the necessary background in signal system probability and random process theory required for the analog and digital communications topics covered in the book
