this volume contains articles related to the conference motives quantum field theory and pseudodifferential operators held at boston university in june 2008 with partial support from the clay mathematics institute boston university and the national science foundation there are deep but only partially understood connections between the three conference fields so this book is intended both to explain the known connections and to offer directions for further research in keeping with the organization of the conference this book contains introductory lectures on each of the conference themes and research articles on current topics in these fields the introductory lectures are suitable for graduate students and new ph d s in both mathematics and theoretical physics as well as for senior researchers since few

mathematicians are expert in any two of the conference areas among the topics discussed in the introductory lectures are the appearance of multiple zeta values both as periods of motives and in feynman integral calculations in perturbative qft the use of hopf algebra techniques for renormalization in qft and regularized traces of pseudodifferential operators the motivic interpretation of multiple zeta values points to a fundamental link between motives and qft and there are strong parallels between regularized traces and feynman integral techniques the research articles cover a range of topics in areas related to the conference themes including geometric hopf algebraic analytic motivic and computational aspects of quantum field theory and mirror symmetry there is no unifying theory of the conference areas at present so the research articles present the current state of the art pointing towards such a unification

algebra and number theory have always been counted among the most beautiful mathematical areas with deep proofs and elegant results however for a long time they were not considered that important in view of the lack of real life applications this has dramatically changed nowadays we find applications of algebra and number theory frequently in our daily life this book focuses on the theory and algorithms for polynomials over various coefficient domains such as a finite field or ring the operations on polynomials in the focus are factorization composition and decomposition basis computation for modules etc algorithms for such operations on polynomials have always been a central interest in computer algebra as it combines formal the variables and algebraic or numeric the coefficients aspects the papers presented were selected from the workshop on computer algebra and polynomials which was held in linz at the johann radon institute for computational and applied mathematics ricam during november 25 29 2013 at the occasion of the special semester on applications of algebra and number theory

topics include matrix geometric invariant vectors buffer models queues in a random environment and more

contains articles of significant interest to mathematicians including reports on current mathematical research
