specialist periodical reports provide systematic and detailed review coverage of progress in the major areas of chemical research written by experts in their specialist fields the series creates a unique service for the active research chemist supplying regular critical in depth accounts of progress in particular areas of chemistry for over 80 years the royal society of chemistry and its predecessor the chemical society have been publishing reports charting developments in chemistry which originally took the form of annual reports however by 1967 the whole spectrum of chemistry could no longer be contained within one volume and the series specialist periodical reports was born the annual reports themselves still existed but were divided into two and subsequently three volumes covering inorganic organic and physical chemistry for more general coverage of the highlights in chemistry they remain a must since that time the spr series has altered according to the fluctuating degree of activity in various fields of chemistry some titles have remained unchanged while others have altered their emphasis along with their titles some have been combined under a new name whereas others have had to be discontinued

evaporation technology in food processing volume nine in the unit operations and processing equipment in the food industry series explains the processing operations and equipment necessary for recent invented non thermal processing of different food products including ozonation plasma processing pulsed electric fields high pressure processing irradiation and high frequency processing these processes and unit operations are very important in terms of achieving favorable sensory properties and energy usage written by experts in the field of food engineering this book targets industrial engineers working in the field of food processing and within food factories divided in four sections evaporation basics different types of evaporators application of evaporators in the food industry and design control and efficiency of evaporators all chapters emphasize basic texts relating to experimental theoretical computational and or applications of food engineering principles and the relevant processing equipment to evaporation unit operations thoroughly explores the processing operations and equipment necessary for the evaporation of different food products applying steam brings new opportunities in food processing through innovative evaporation processes covers

*industrial chemical process analysis and design second edition uses chemical engineering principles to explain the transformation of basic raw materials into major chemical products the book discusses traditional processes to create products like nitric acid sulphuric acid ammonia and methanol as well as more novel products like bioethanol and biodiesel in addition to providing full code and datasets for download detailed discussion of advanced in technology this edition also contains three new chapters firstly covering polymers including h and l d p e pmma pc biobased and full analysis of each including full code for modelling across popular software secondly evaluating phosphoric acid production and fertilizers and finally the third new chapter focuses on blast furnaces outlining not only the traditional technologies using c as reducing agent but also analysis of novel technologies using hydrogen this book will be a comprehensive guide to students and academics working with the latest techniques in process optimization at graduate level and above including some upper undergraduate researchers this book will also be very valuable for academics looking to teach or lecture in chemical process engineering this books will also be a very useful resource for anyone within the process industry to introduce the analysis of novel technologies as well as the modelling examples including recent software such as python gproms or even excel or matlab to solve reactor modelling and units operation but also process simulators applied to typical chemical processes integrates principles of chemical engineering unit operations and chemical reactor engineering to understand process synthesis and analysis includes historical perspectives and traces the improving efficiencies of commercially important chemical production processes provides a systematic analysis of the processes building on thermodynamics kinetics mass and energy balances reactor engineering and unit operations details different software packages to solve the examples from general purpose ones such as excel or new ones like python to specialized ones such as process simulators chemcad or gproms features worked examples and end of chapter problems with solutions to show the application of concepts discussed in the text*

*while a satisfactory description of liquid vapour equilibria in binary and multi component systems had been developed by the end of the fifties a similar situation has only been attained for liquid liquid equilibria in the last ten years there are several reasons for this the most important of which is the necessity to employ more complex thermodynamic models for a quantitative description of liquid liquid equilibria these models require very sophisticated calculation techniques that cannot be carried out without the assistance of a computer the authors have attempted to provide a theoretical description of liquid liquid equilibria at a level permitting routine chemical engineering applications similar to those common for liquid vapour equilibria consequently a great deal of attention is paid to the calculation of parameters for heterogeneous and homogeneous binary systems and to the qualitative evaluation of the suitability of the most frequently used thermodynamic models*

*this detailed volume presents protocols centered on the sensing and signaling of ethylene a plant hormone with a vital role in fruit ripening seed germination stress adaptation and a wide array of developmental processes beginning with a section on ethylene detection and quantification techniques including gas chromatography and analysis during hypoxia and pathogen interactions the book continues by examining the role of ethylene in post harvest biology and fruit ripening and associated regulatory mechanisms including promoter characterization and protein protein interactions further sections explore bioinformatics workflows for unraveling mechanistic roles of ethylene at the cellular and whole plant levels as well as the regulatory capacity of ethylene in plant developmental processes root system modifications and adaptation to diverse biotic and abiotic stressors written for the highly successful methods in molecular biology series chapters offer readers a hands on approach to investigate the myriad roles that ethylene plays in plant growth and development authoritative and practical ethylene sensing and signaling serves as a key resource for scientists seeking to employ reliable methodologies in understanding the central function of ethylene in plant biology*
